South Central East Community Wildfire Protection Plan

Introduction

The purpose of this Community Wildfire Protection Plan (CWPP) is to provide a tool for effectively managing fire and hazardous vegetative fuels and to bolster collaboration and communication among the various agencies and organizations who manage fire in the south central east portion of Nebraska. Having a CWPP in place allows the Nebraska Forest Service (NFS) to apply for federal grant dollars to cost-share forest fuels reduction treatments in at-risk areas within the boundaries of the CWPP. It also may increase opportunities for counties, municipalities, and rural fire districts to seek grant funding for activities related to fire protection.

A CWPP can help people be proactive in their approach to wildfire. All of the CWPP counties have experienced wildfires larger than 200 acres, some much larger. Historically, wildfires burned huge swaths of prairie and woodlands, destroying homes and lives. NFS data shows that between 2000 and 2020, volunteer fire departments (VFDs) in the CWPP area reported 43 fires greater than 99 acres in size that burned more than 13,235 acres. Four of those fires exceeded five hundred acres each. Because not all fire departments report every year, the actual numbers are likely much higher.*

These incidents demonstrate that intense fire behavior can start in rural areas, move aggressively over large expanses, and threaten population centers. For this reason, the CWPP planning team has designated the entire CWPP region as Wildland Urban Interface (WUI). Treatment to reduce dense vegetation can help lessen the risk of wildfire within the WUI. The NFS can utilize federal and state grant funding to cost-share fuels reduction treatments throughout the CWPP region.

Legislative Background

To be eligible for federal conservation cost-share funding assistance, the US government requires states to prepare action plans that lay out a strategy for forest and wildlife conservation. The Nebraska Game and Parks Commission (NGPC) published the Nebraska Natural Legacy Project (NNLP) in 2005 as the state’s first Wildlife Action Plan (updated in 2011). It identified 40 biologically unique landscapes (BULs) to help prioritize where conservation work can best be directed. The South Central East CWPP region lies within the Tallgrass and Mixedgrass Prairie Ecoregions identified in the NNLP. All of the Sandstone Prairies and much of the Rainwater Basin BULs are found within this CWPP boundary (see Appendix A).

In accordance with the 2008 Farm Bill’s requirement for states to conduct a comprehensive analysis of their forests, in 2011 the NFS published the Statewide Forest Resource Assessment and Strategy, known as the Forest Action Plan (FAP). This plan was updated in 2015 and 2020. Priority forest areas were identified throughout the state using the National Land Cover Dataset. This dataset represents 15 land cover and land use types including open water, development, crops, shrubs, grasslands, wetlands, and forests. Portions of the Blue Rivers, Republican River, and Lower Platte River Priority Landscapes (PLs) are located within this CWPP boundary (Map 2). A full description of the PLs is found in the Nebraska Forest Action Plan: https://nfs.unl.edu/statewide-forest-action-plan.

The Healthy Forest Restoration Act (US Congress, 2003) requires CWPPs to be developed collaboratively; identify and prioritize areas for fuels reduction and methods to reduce fuels on those areas; and recommend strategies to reduce structural ignitability. This CWPP addresses these requirements and other needs identified by stakeholders.

* Paid fire departments do not report their responses to NFS, but some of these departments do respond to wildfires and provide mutual aid. They report their statistics to the National Fire Incident Reporting System (NFIRS), a voluntary reporting standard that fire departments use to uniformly report on the full range of their activities, from fire to emergency medical services to severe weather and natural disasters.1
Plan Integration

This CWPP strives to coordinate with existing federal, state, and local plans and provides specific detail on wildfire hazards, areas at-risk from wildfire, emergency operations and capacity, and critical infrastructure. It includes an action plan addressing wildfire-specific issues including a risk assessment procedure, risk reduction measures, preparedness recommendations, training and education, fuels mitigation strategies, and a monitoring and evaluation plan.

The components of the State Emergency Operations Plan are patterned after the National Response Plan. The Nebraska Emergency Management Agency (NEMA) prepared a basic plan that details Nebraska’s operational functions approach to the response and recovery phase of emergency management. It defines the roles and responsibilities of the responding and supporting agencies and organizations and defines broad policies, plans, and procedures.²

Each county has its own Local Emergency Operations Plan (LEOP). The content of these plans is defined by statute, which stipulates that each county’s LEOP consists of specific components, including operations, organization, and responsibilities; functional annexes supporting activities critical to emergency response and recovery; technical information on response procedures; protective measures unique to a hazard; and methods for use in emergency operations. It is the responsibility of local emergency management staff to maintain the LEOP according to the guidance from the State.²

Each LEOP contains an ‘Annex F’ that covers fire services and includes a listing of county fire departments and mutual aid (MA) partners, as well as equipment lists. Fire department information is listed in Appendix G of this CWPP. Mutual aid associations are listed in Appendix F. One of the gaps common to many county-level LEOPs is a lack of wildfire-specific information. In many, fire is lumped in with hazardous materials. The information contained in this CWPP is intended to augment existing information and support these LEOPs.

Nebraska also has a state Hazard Mitigation Plan (HMP), which establishes the policies, plans, guidelines, and procedures for the Hazard Mitigation Program in Nebraska. NEMA coordinated with regional emergency management agencies, Natural Resources Districts (NRDs), and counties to update and maintain multi-jurisdictional hazard mitigation plans throughout the state.³ All of the counties in the CWPP region are included in the Lower Big Blue NRD and Little Blue NRD HMP (see link in Appendix C).

Goals and Objectives

State Action Plan Goals and Objectives

The 2020 FAP goals and objectives are listed below:

1. Enhance and promote the role of Nebraska’s forests and trees for mitigation and adaptation to the global change in climate
2. Manage trees and forest landscapes to include rural and community forest settings
3. Manage the function of forest and tree systems in Nebraska for maximum and sustained benefits
4. Improve, protect, and enhance fish and wildlife habitat in Nebraska
5. Restore fire-adapted landscapes to reduce risk of wildfire impacts on Nebraska’s trees, forests, and communities
6. Manage for the health and productivity of Nebraska’s trees and forests
7. Manage and build the capacity of Nebraska’s trees and forests, in conjunction with the forest products industry, agriculture, and communities, which are all vital to Nebraska’s economy
8. Maintain the natural environments of Nebraska including trees and forests, waterways, and rangelands
9. Manage Nebraska’s forest and trees to enhance the water resources of Nebraska
10. Improve air quality and energy conservation through tree planting
11. Connect people to the state’s trees and forest resources
12. Engage Nebraskans in the stewardship of trees and forests

² South Central East Community Wildfire Protection Plan  ■  DRAFT 2022
South Central East Community Wildfire Protection Plan

This CWPP and the results of its implementation relate directly or indirectly to all of these. Sustainable forest management maintains natural environments and reduces negative wildfire impacts in the region’s forests and adjacent communities, and it reduces threats to ecosystem health. Healthy forests and grasslands, in turn, protect air and water resources and fish and wildlife habitat, helping these ecosystems better cope with a changing climate. Communities that plan for and reduce wildfire risks and engage in environmental stewardship activities may also reap both direct and indirect economic benefits of healthy forests in fire-adapted landscapes.

Implementation of this CWPP relates directly to the NNLP goals of conserving natural communities, keeping common species common, and protecting at-risk species. Sustainably managed, fire-adapted forests include diverse habitats for both at-risk and common species. Restoring unnaturally dense forests to a more natural mosaic vegetative pattern benefits both wildlife and human communities.

CWPP Goals and Objectives
The steering committee identified the following goals and objectives that are consistent with the state FAP and specific to community wildfire protection planning in the middle northeast part of Nebraska. It is important to note that these are goals, not mandates. This begins the process of documenting needs and proposed solutions, which may provide new opportunities to address a variety of issues. Goals such as these can help tie grant applications directly to specifically-identified needs—a strategy that has been proven to increase the likelihood of funding. Any movement toward these goals can be considered progress. Proposed strategies and tactics to achieve these goals are included in the Action Plan section of this document and in Appendix B.

Goal 1: Reduce wildfire risk
Objectives
- Identify wildfire risks, areas of concern that contain these risks, and a range of mitigation measures to address them
- Assess risks in the areas of concern
- Mitigate risks: Implement measures to create defensible space and reduce structural ignitability

Goal 2: Support emergency response
Objectives
- Assess local response capacity
- Enhance local response capacity
- Improve firefighter readiness and safety
- Enhance communication among fire management agencies

Goal 3: Promote an informed and active citizenry for wildfire preparedness
Objectives
- Increase local knowledge of wildfire risk and prevention
- Engage stakeholders in preparedness activities that promote the use of defensible space to protect communities and resources

Goal 4: Restore fire-adapted ecosystems
Objectives
- Encourage land managers to reduce heavy understory fuels in woodlands
- Encourage land managers to control non-native invasive plant species and to actively manage prolific and aggressive native species
- Encourage land managers to use native plant species when restoring ecosystems
- Safely incorporate prescribed fire, using trained personnel and standard operating procedures

Goal 5: Enhance post-fire recovery
Objective
- Enable rapid assessments of burned lands and the implementation of stabilization techniques

Goal 6: Establish/implement a CWPP monitoring and evaluation process
Objectives
- Annually evaluate progress in implementing the CWPP and recommend changes as needed
• Monitor selected projects and activities to assess progress and effectiveness
• Improve grant eligibility by keeping planning documents up-to-date to reflect current activities and needs

Priority Landscapes
At the state level, the FAP identified PLs to help focus effort and funding on landscape-scale approaches. This CWPP region includes portions of the Blue Rivers, Republican River, and Lower Platte River PLs (Map 2). These landscapes include many locally identified ‘Areas of Concern’ where vegetative fuels reduction activities can be targeted (see map in Appendix A).

Unnaturally dense and unhealthy woodlands and encroachment of eastern redbud into grasslands create extreme wildfire risk. Drought cycles are predicted to occur with increasing frequency. Communities can protect structures by reducing their ignitability, reducing the surrounding woody fuels, and improving access for emergency equipment. Priority Landscapes help focus management activities on areas most at-risk.

Map 2: The principal Priority Landscapes in this CWPP region are located along the Little Blue, Lower Big Blue, and Republican Rivers, plus a small part of the Lower Platte River PL in Adams County. These landscapes include many locally-identified Areas of Concern. A map of the Areas of Concern is located in Appendix A.

Vegetation Types and Areas of Concern within Priority Landscapes
The PLs contain a range of topography and vegetation types including deciduous forest (upland mixed deciduous and riparian woodlands) and several types of tallgrass and mixed-grass prairie (Map 3). Within each county, local stakeholders have identified ‘Areas of Concern’—specific sites that are at greatest risk for wildfire within the larger landscapes. Most of these are located within the PLs. (See Appendix A.)

Managing the grass component of the forested areas is extremely important. Deciduous woodlands can develop a heavy grass and shrub component which, if not managed appropriately, create a hazardous fuels risk. The best management is done on a landscape basis—fuels mitigation treatments are only as effective as their weakest link. Unmanaged ‘islands’ within managed areas pose a significant risk to the managed lands.
Process

The first step in the CWPP planning process was to establish a core working group of stakeholders to form a steering committee and planning team. Information about the purpose of the CWPP and an invitation to participate in the process was given to each of the eight county boards and their emergency managers within the region. Counties appointed individuals to the steering committee to help guide the process.

An outreach notice was sent to stakeholders and other potentially interested parties, including fire districts within the CWPP region, municipal governments, natural resources districts, federal and state agencies, state legislators, and non-government conservation organizations. The steering committee was rounded out from responses to this outreach. Containing a mix of county board appointments and volunteers, it included representatives from local and state emergency management, fire departments, NRDs, the NFS, the Natural Resources Conservation Service (NRCS), and the NGPC (See Appendix I).

For planning purposes, each county within the CWPP boundary is considered a WUI community. County officials, fire department personnel, and steering committee members identified areas of concern within each county that may be particularly at-risk from wildfire. The committee adopted CWPP goals and objectives and provided the locally focused framework for the plan.

The planning team (a subset of the steering committee) gathered pertinent data, seeking input from county officials, fire departments, and others as needed to provide background and overview information, determine local wildfire risk factors, map areas of concern, assess risks, and recommend an action plan.
South Central East Community Wildfire Protection Plan

The NFS sent a questionnaire to the fire departments in the CWPP region asking for current contact information, list of equipment, as well as issues, concerns, and priorities. 21 of the 57 fire departments returned the survey. Their responses appear in Appendix G, along with information obtained from Annex F of each county’s LEOP for all fire departments located entirely or partially within the CWPP boundary. The fire department survey and distribution list appear in Appendix H.

A news release sent to local newspapers and radio stations described the planning process, encouraged input, and provided contact information for comments. CWPP information was posted on the NFS website and social media page to extend the outreach. The stakeholder list, outreach letters, and media releases appear in Appendix I.

The team prepared a draft document that was released for a 30-day public review period. Comments were incorporated into the final document, as appropriate. It was then sent to the county boards for signature. Final copies were provided to county boards and emergency managers. The plan is also available online at https://nfs.unl.edu/documents/CWPP/SCECWPP.pdf.

Overview

This section contains background information common to all counties within the CWPP region. Information specific to only certain areas is included in the individual county sections.

Landforms, Climate and Weather

The South Central East CWPP region lies within the Tallgrass Prairie and Mixedgrass Prairie Ecoregions. Most of this area sits atop the Ogallala Aquifer, which underlies about 175,000 square miles in eight states from Texas to South Dakota (Map 4).
Nebraska has a continental climate with cold winters and hot summers. Severe droughts have occurred in recent decades. Extreme wildfire years occurred in 1988, 1994, 2000, 2006, and 2012.

Weather data was obtained from the University of Nebraska High Plains Regional Climate Center and Iowa State University. Weather factors, including temperature, precipitation, relative humidity (RH), and wind, define fire season, as well as fire direction and speed. There are two fire seasons in this area. The early fire season occurs from snowmelt and the last spring frost (when the previous year’s cured vegetation dries) until early May, then eases as vegetation greens up. The late season begins in mid to late summer as fine fuels, such as grasses and forbs, begin to dry. In most years the late season extends to mid-November, coinciding with agriculture crop harvests, leaf drop, and curing of prairie grasses. Wet springs can delay the onset of the early season, but they produce more fine fuels in ditches and across rangelands that, in late summer and fall, become tinder for sparks that can start wildfires. In drier years fine fuels can start curing by mid- to late July, but there is less growth, and consequently fewer fine fuels to catch sparks from farm equipment or motorists.

Table 1: Average maximum temperatures (degrees F), precipitation (inches) and median minimum relative humidity (percent) 1982-2020 for April, July, and October for the South Central East CWPP counties. Relative humidity (RH) data interpolated from selected weather stations.

Wind is a primary factor in fire spread, even where fuels are light and/or discontinuous as it is in much of the plan area. Many areas are more than half agriculture and grass fuels. Wind rosettes for April, July, and October from four stations in or near the plan area—Beatrice, Hastings, Hebron, and York—are in Appendix D.

**Vegetation and Natural Communities**

Native vegetation in the South Central East CWPP Region is primarily tallgrass prairie and mixed-grass prairie, with riparian deciduous forests in the drainages and patches of upland deciduous forests scattered throughout the region (see Map 3). Eastern redcedar occurs within some of the deciduous woodlands along the rivers and their tributaries, and in some areas has encroached into the prairies. Agricultural fields occupy most of the region. A land cover map appears in Appendix A.

The principal deciduous tree species are eastern cottonwood, hackberry, bur oak, black walnut, silver maple, green ash, wild plum, gray dogwood, elderberry, mulberry, elm spp., and honeylocust. Most of the green ash is expected to die when the emerald ash borer, an invasive pest, moves into the region. Other woody species that are locally abundant include eastern red cedar, sand cherry, smooth sumac, and chokecherry. Riparian deciduous woodlands follow the major drainages. Most of the deciduous trees and shrubs are found in stringers and patches along the drainages with cooler, more humid environments. In general, fuel continuity in the forested areas is high. Other forested areas are primarily hardwoods that are scattered throughout the area, usually in areas of non-tillable land.
Within this CWPP region the Sandstone Prairies BUL identified within the NNLP, is found in Jefferson and Thayer Counties, south of Fairbury. According to NGPC staff, more of this type of fire-influenced habitat exists in Nuckolls and extending through Webster Counties, especially south of the Republican River.

**Land Use**

There are about 2,939,520 acres (4,593 sq. mi.) in the CWPP region, which includes Adams, Clay, Fillmore, Jefferson, Nuckolls, Saline, Thayer, and Webster Counties. In addition to county and municipal properties, public lands include 10,615 acres in US Fish and Wildlife Service (USFWS) Waterfowl Protection Areas; 34,641 acres at USDA/UNL’s Meat Animal Research Center (MARC); 3,282 acres at the Greenlief National Guard Training Site west of MARC, 8,616 acres in 35 NGPC properties including Wildlife Management Areas (WMAs), State Recreation Areas (SRAs), and a State Historical Park (SHP); and 1,543 acres in 11 NRD-managed sites. Nebraska School Lands constitute approximately 6,351 acres in the region.9 The remainder of the land in these counties is privately owned. Non-government conservation organizations manage 2,579 acres in seven tracts.

Agriculture (crops and livestock) is the predominant use on rural private and school lands. Residential, commercial, manufacturing, and industrial land uses dominate the region’s 65 incorporated cities and villages and their immediate surroundings. Land use is primarily agricultural in the region’s nine unincorporated communities. Rural residential land use exists in conjunction with agricultural operations. According to US Census data, in 2020 there were 76,916 permanent residents in the eight counties within the CWPP region.

All counties in the CWPP region except for Nuckolls have county zoning plans in place. There are currently no restrictions in any of the counties for new building construction in fire-prone areas. The City of Hastings has adopted Chapter 4 and Sections 603 and 604 of the 2018 *International Wildland Urban Interface Code*, but there are no zoning overlays adopted. Some of the zoning does address landscaping and greenbelts, but nothing specifically geared towards the WUI.

Popular outdoor recreational activities include hunting, fishing, hiking, biking, and camping at public recreation areas in the region. Over 13,000 people visit Rock Creek Station SHP and SRA annually.10 Although no visitor numbers are available for state WMAs, NGPC staff reports significant use by recreationists. The Little Blue NRD reported annual visitation of over 1,600 at three of its recreation sites. The Lower Big Blue NRD does not track public visitation numbers at their sites.

**Wildland Urban Interface**

The WUI is defined as areas where homes and other structures are built on or near lands prone to wildfire. According to the ‘Ready, Set, Go!’ program, managed by the International Association of Fire Chiefs, the WUI is not necessarily a place, but a set of conditions that can exist in nearly every community. It can be a major subdivision, or it can be four homes on an open range. National Fire Protection Association literature states that conditions include, but are not limited to, the amount, type, and distribution of vegetation; the flammability of the structures in the area and their proximity to fire-prone vegetation and to other combustible structures; weather patterns and general climate conditions; topography; hydrology; average lot size; and road construction. The WUI exists in every state in the country, and in every county/community within the CWPP boundary. Site-specific WUI issues are listed in each county section of this CWPP.

**Infrastructure**

Webster defines infrastructure as: “the system of public works of a country, state, or region; also: the resources (such as personnel, buildings, or equipment) required for an activity.” In the CWPP region, infrastructure includes county, state, and federal roads and bridges, communications systems, the power grid, water systems, hospitals, schools, parks and fairgrounds, public administration buildings, fire halls, public officials, law enforcement officers, and fire personnel. These systems, structures, and people are critical to regional functionality. One of the goals of community planning is to protect the basic physical and organizational structure of communities. This infrastructure, in turn, protects citizens.
Regional infrastructure expedites access to a fire by emergency responders, allows them to communicate with one another and the public, facilitates evacuations and support functions, and assists recovery efforts after the event. It is important for both local and out-of-area responders to know what facilities and resources are available and where they are located.

Emergency evacuations depend on infrastructure. Immediate evacuation destinations are likely to be in areas away from the fire that have water, power, and room for gathering. Fairgrounds and parks often make good short-term destinations, as they have large parking areas, restrooms, and electricity. In a wildfire evacuation scenario, local officials will designate immediate evacuation destinations. During prolonged evacuation periods or when homes or access routes have been destroyed, longer range planning is needed.

The Participant Profiles sections of regional HMP identify specific sheltering locations, which are primarily the mass care facilities identified in the county LEOPs. The Department of Homeland Security’s website https://www.ready.gov/evacuating-yourself-and-your-family also offers some ideas.

The CWPP region is crossed by several high-tension power lines. Rural electric service in the counties is provided by the South Central Public Power District (PPD), Norris PPD, Perennial PPD, Southern PPD, and Hastings Utilities. Both cellular and landline telephone services are available regionwide. Cellular reception is spotty in some parts of the region.

Hazardous Fuels Reduction

Hazardous fuels reduction is key to decreasing risks to human life and damage to property. In terms of wildfire, hazardous fuels include any kind of living or dead vegetation that is flammable. Implementation of hazardous fuels reduction projects reduces fuels that feed wildfires, resulting in less extreme fire behavior and intensity. Fire behavior reductions include decreased rates of spread and shorter flame lengths. Fuels treatment can be accomplished via several approaches, including forest thinning, fuelbreak and firebreak establishment, prescribed fire, prescribed grazing, and implementing Firewise® practices around structures. Table 2 shows acres of vegetation treatments implemented over the past five years in the CWPP region.

Mechanical Treatment

Mechanically removing eastern redcedar can be expensive, depending on access, terrain, and tree size and density. It is often accomplished by using equipment ranging from chainsaws and hand-held weed trimmers with saw blades to ATV-mounted cutters and hydraulic shears mounted on skid-steers or tractors. As tree size, tree density, and slope increase, so do the costs.

The NFS, NGPC, and NRCS offer cost share programs to help private landowners mechanically reduce hazardous woody fuels or improve wildlife habitat and range conditions on their properties. Landowners in counties that adopt this CWPP are eligible to participate in the NFS cost share program for mechanical fuels reduction.

In addition to offering cost share assistance to private landowners, natural resources agencies also use mechanical treatments on the public properties they manage. On NGPC lands, Wildlife Division staff reports that firebreak placement moves annually. Some haying occurs, related to specific site and habitat objectives, but is infrequently applied. For state park lands, acres related to mowed areas managed specifically for public uses (i.e. campgrounds). Most tree removal work would be considered incidental on these areas, where fire is routinely applied. Fuels reduction is discussed in detail in the Action Plan section of this document.

Prescribed Fire and Prescribed Burn Associations

In recent years, prescribed fire has increased as a method of keeping woody encroachment in check, particularly in grasslands, where it can be extremely efficient for managing eastern redcedar. In forested settings where eastern redcedar is present, prescribed fire is more effective and safer when used to maintain woodlands after
they have been mechanically thinned. When tree densities are reduced prior to burning, it is easier to keep the fire on the ground, where it cleans up downed woody fuels. Crown fires are difficult to control, and they kill healthy trees.

Prescribed fire practitioners include individual landowners, groups of landowners in organized prescribed burn associations (PBAs), non-profit organizations, and public agencies. The NGPC and many non-government conservation organizations use prescribed fire as an effective land management tool on state and non-profit lands. On NGPC WMAs, all acres generally have prescribed fire applied at least once within a 5-year planning window. There are exceptions for WMAs with riparian woodlands, due to seasonal difficulties with burning in these habitats and fuel types. All prescribed burn units use haying and/or tilled firebreaks dependent on habitat context. There is also significant and routine use of prescribed fire at the Rock Creek Station SHP for maintenance of those oak-prairie savannah and prairie habitats.

The Pheasants Forever (PF) statewide Prescribed Fire (RxB) Association map shows the currently inactive Rainwater Basin PBA includes Fillmore, Nuckolls, Clay, and part of Adams Counties. The currently inactive South Central Nebraska PBA includes the rest of Adams County, Webster County, and neighboring counties west of the CWPP region. The Tri-County PBA is active, and it includes Saline County. PF reports this group burned about 400 acres in 2021, but no county-level data is available.

* These NGPC acres are variable annually.

Table 2: Estimated acres of vegetation treatment (prescribed fire, mechanical, chemical) in the South Central East CWPP Region counties during the past five years. Other treatments may have occurred, but only entities that reported treated acres are included in this table.

Prescribed Grazing and Haying
Grazing can have a positive impact on fuels reduction on both private and public lands. Many landowners who use RxB also use planned grazing to reduce the potential for fire escape and spotting on lands adjacent to the burn units. According to NGPC staff, prescribed grazing is most frequently applied on WMAs within the Rainwater Basin Wetland area. Grazing on these sites is typically done in combination with chemical application to limit perennial emergent wetland vegetation and increase annual plant production and open water areas within the larger wetland. Upland grazing is applied situationally on WMAs but is variable annually.

Targeted haying practices can also impact fuels reduction. Some private landowners hay areas adjacent to prescribed burn units to minimize the potential for spot fires. On NGPC lands, Wildlife Division staff reports that...
some haying occurs on WMAs, related to specific site and habitat objectives, but is infrequently applied. For state park lands, mowed areas are managed specifically for public uses such as campgrounds.

**Chemical Treatment**
Some entities use chemical treatments to manage vegetation for habitat improvement, noxious weed control, agricultural production, or other purposes. NGPC staff notes that all of their properties are rogued and treated as needed annually for invasive plants. Many of the areas within the CWPP region are Rainwater Basin Wetlands. Chemical is periodically applied to limit perennial emergent wetland vegetation and increase annual plant production and open water areas within the larger wetland.

**Emergency Management and Fire Districts**
Jefferson and Saline Counties have a unified emergency management jurisdiction. The other counties each have their own full time emergency manager. Map 5 shows the CWPP’s local emergency management areas. A map of statewide Local Emergency Management Areas appears in Appendix A.

There are 57 fire districts all or partially within the CWPP boundary (see Map 5). Some VFDs voluntarily report their fire responses to the NFS statewide wildfire tracking database. Reported fires by district are summarized in Table 4. Paid fire departments do not report their responses to NFS, but some of these departments, including Hastings Fire and Rescue, do respond to wildfires and provide mutual aid. They, along with over 24,000 other fire departments nationwide report their statistics to the NFIRS, a voluntary reporting system used to uniformly report on the full range of their activities, from fire to emergency medical services to severe weather and natural disasters.¹

Each fire department in the CWPP region was asked to provide current contact information, equipment lists, and a summary of their wildfire issues and concerns. The responses received appear in Appendix G.

Wildfire Hazard: History and Impacts

Historic Role of Fire
Prior to European settlement, large fires (started by lightning or intentionally as management activities by indigenous people) were common, and these fires kept the prairies free of most woody vegetation, except along the rivers and streams. Table 3 shows the wooded draws and ravines experience a mean replacement fire interval of 45 years, while the mean replacement fire interval for floodplain forests was 500 years \(\text{(note: the flooding-caused replacement interval for these forests may be more frequent)}\). The prairies in the region may have experienced a replacement fire interval of five to fifteen years prior to Euro-American influence. However, since settlement, people have become increasingly adept at suppressing wildfire. Without fire, over time, forests became densely overcrowded and woody vegetation encroaches on prairies.

Table 3: Fire intervals for the South Central East CWPP vegetation communities.\(^{11}\)

Local Fire History
Nebraska is no stranger to extremely large fires. In 1865 the US Army and ranchers intentionally set a 300-mile-wide prairie fire during a dispute with Native Americans. The fire blackened the entire section of Nebraska south of the Platte River and west of Fort Kearny. It was visible from Colorado and Kansas, and eventually burned all the way to Texas.

In the CWPP area, wildfires exceeding 200 acres in size have occurred in all of the counties, and fires larger than 400 acres have occurred in all but Adams and Thayer Counties. The largest fire reported to the NFS was 3,500 acres in the Grafton Fire District in November 2012. Map 6 shows the locations of some of the larger fires reported in the CWPP area since 2000.

In 2012, fire departments from across the state, including some in the CWPP region, provided support for major wildfires that burned nearly half a million acres in the Niobrara Valley and the Pine Ridge areas of Nebraska. As observed that year, and evidenced in historical research, rivers are not always a barrier to fire spread.\(^{12}\)
Map 6: Some of the larger fires reported in the CWPP area since 2000 are shown in the map above. Departments reported 43 fires greater than 100 acres that burned over 13,000 acres.

Some fire districts voluntarily report their annual fire response data to the NFS. Table 4 shows the fire data reported by fire departments from 2000 through 2020.13 Because the fire districts vary in their level of reporting, there is no accurate, comprehensive fire history available for the CWPP area.
Table 4: Fires reported by South Central East CWPP VFDs from 2000 through 2020. Departments reported a total of 39,799 volunteer hours for this period. Only departments that reported are listed. Some departments did not report every year. Actual numbers are higher. VFDs report the total number of fires and acres for their district. These figures were not adjusted for districts that include land outside of the CWPP region. In addition to VFD reported numbers, Hastings Fire and Rescue, a paid municipal department, reported responding in 2019-2020 to 23 grass fires (3 acres) and 12 mutual aid grass fire calls.
Fire Hazard

In the years since European settlement, exclusion of low-intensity ground fires and prolific regeneration of eastern redcedar have increased the fire hazard in both prairies and woodlands. During most years the majority of wildfires are small and do not burn with high intensity because of rain or quick suppression. However, in some years medium-sized and large fires occur and burn with high intensity and extreme fire behavior, posing a threat to rural homes. Often the fires are wind-driven from the southwest or northwest and can burn at a rapid rate. This situation challenges fire suppression personnel and agency managers to remain vigilant while monitoring the fire danger ratings and indices. Fuel continuity is high in the forested areas and in some of the open grasslands in this region. Fires in these areas can have a high rate of spread and, in the forests, a high resistance to control during very high and extreme fire danger.

Planning team members and local fire departments identified specific ‘Areas of Concern’ for wildfire response in each county in the CWPP region. These locations include the edges of municipalities and wooded areas along rivers and creeks where there are homes and other structures. Some of these areas experience heavy seasonal visitor use, have limited access and/or water availability, are high-risk ignition sources due to dense undergrowth, and they often experience dry weather conditions conducive to fire ignition from lightning and hot farm machinery. The team stressed the importance of addressing fuel load reduction in mitigation plans. Areas of Concern are described in each community-specific section of the CWPP and shown on a map in Appendix A.

The entire CWPP region is included in the Blues NRD local mitigation planning area (see map in Appendix A), which has its own Multi-Jurisdictional HMP that includes a discussion of wildfire hazard (see link in Appendix C). This CWPP builds on the HMP to address specific wildfire concerns.

Fuel Moisture

Dead fuels are classified according to how fast they gain and lose moisture. They are categorized into 1, 10, 100, and 1,000-hour fuel size classes. The larger the fuel, the longer it takes for the weather to affect it. Large branches (100-hour fuels) will take much longer to dry out than dead fine fuels such as grass (1-hour fuels). Once 100- and 1,000-hour fuels become dry, it also takes a long time for them to regain moisture from wetter weather. See Appendix E for more information on fuel models.

Fuel Models

According to the Nebraska Wildfire Risk Assessment Portal, the following fuel models are the most prevalent within the CWPP region:

Grass Models
- GR2 (regionwide) Moderately coarse continuous grass, average depth about 1 foot. Spread rate high, flame length moderate.
- GR6 (regionwide) Dryland grass about 1 to 2 feet tall. Spread rate very high, flame length very high.
- GR8 (western counties) Heavy, coarse, continuous grass 3 to 5 feet tall. Spread rate very high, flame length very high.
- GR3 (western counties) Continuous, coarse, humid-climate grass. Grass and herb fuel load is relatively light; fuelbed depth is about 2 feet.
- GR1 (Adams, Thayer) Grass is short, patchy, and possibly heavily grazed. Spread rate moderate, flame length low.
- GR4 (regionwide) Moderately coarse continuous grass, average depth about 2 feet. Spread rate very high, flame length high.

Timber Models
- TU1 (regionwide, along rivers and major streams) Fuelbed is low load of grass and/or shrub with litter. Spread rate low, flame length low.
- TL2 (eastern counties) Low load, compact. Spread rate very low, flame length very low.
South Central East Community Wildfire Protection Plan

- TL3 (Jefferson, Thayer) Moderate load conifer litter. Spread rate very low, flame length low.
- TL6 (Saline) Moderate load, less compact. Spread rate moderate, flame length low.

Full descriptions of these fuel models appear in Appendix E.

Economic Impacts

Excessive fuel loading can affect local economies in many ways. It reduces available forage, and therefore the grazing carrying capacity, for livestock and wildlife. If woody fuels are removed by uncontrolled, high intensity wildfire, other resources are affected. Intense fires may induce hydrophobic soils, which significantly increase runoff and erosion in steep terrain. Loss of grazing capacity and decreased water quality can be long-lasting problems for landowners whose livelihoods depend on livestock and/or hunting income.

A proactive approach to reducing hazardous fuels can provide jobs and generate valuable wood products such as lumber, posts, and biomass. Mechanically thinning forests reduces the hazard and risk of intense wildfire, can improve grazing capacity and wildlife habitat, and can increase the amount of precipitation that reaches streams, lakes, and the water table. Adherence to the Forestry Best Management Practices for Nebraska (https://nfs.unl.edu/documents/ruralforestry/NebraskaBMP.pdf) by those conducting mechanical thinning operations can reduce the potential for soil erosion from equipment use.

Emergency Operations

Responsibilities and Mutual Aid Agreements

Local fire departments are the first line of defense against wildfires on private and state lands in this planning area and statewide. During large wildfires, they rely on mutual aid (MA) agreements with neighboring jurisdictions. The 57 fire departments in the CWPP area belong to one or more of the nine MA districts that overlap the region: 3 & 33, Fillmore County, Hastings Area, Quad Cities, Saline County, South Central #2, Stateline, Thayer, and the Central Nebraska Fireman’s Association. See Appendix F for a complete list of MA associations and member fire departments.

Emergency managers work closely with fire departments and law enforcement when responding to wildfires and other incidents. In addition to notification by sheriff’s department personnel and/or dispatch, some jurisdictions have notification from ‘Code Red’ that allows them to develop groups that can be called in an emergency situation for notification of evacuations, hazardous material incidents, and any other emergency, including wildfire. This allows notification of a large geographical area or a group of people. This and similar applications are ‘opt-in’ programs which can be used to notify residents in the area of wildfire events but would likely not reach everyone.

The state introduced the Salamander identification card check-in system for emergency response personnel and equipment prior to the 2012 wildfires. This identification and credentialing system allows first responders (agencies, personnel, and equipment) to respond to incidents more efficiently. It streamlines the incident check-in process and tracks time spent on an incident for both personnel and equipment. The cards use bar codes that identify equipment, people and their qualifications, and can track volunteers. The Salamander Command program and the Salamander Track App are used to track incidents.

Staging Areas and Safety Zones

The forested drainages in the CWPP region are separated by expanses of grasslands and farm ground. There are abundant staging area locations in the uplands away from the drainages. Grazed pastures, green alfalfa fields, and fallow farmland can provide staging areas away from forested areas. Fairgrounds and municipal parks are generally good staging areas, depending on the particular location of a wildfire. Safety zone sites are designated by fire officials and depend upon the wildfire location and characteristics.
Roads/Bridges
In addition to the federal and state highways, the region is served by a network of county-maintained roads. Farm and ranch trails provide additional access for emergency vehicles. Restricted bridges and roads which could restrict truck/lowboy passage have not been mapped in some of the region’s counties. Developing such a map has been identified as a need that should be addressed (see Action Plan section of this document).

Communications
Some radio compatibility issues in Nebraska were addressed after the 2012 wildfire season. Location-specific information about communications is listed in each county section of this CWPP for those entities that responded to requests for information. Gaps in cellular service exist across some parts of the CWPP region, particularly in steeper drainages.

Capabilities and Capacity
Resources to support emergency responder safety and help fire departments prepare for and respond to fire, natural disasters and non-fire emergencies can include vehicles, equipment, air support, and personnel. The resources described in this section are available to VFDs in Nebraska.

Vehicles and Equipment
A listing of apparatus and staffing for each fire district is included in Appendix G. Through the Federal Excess Property Program (FEPP) and Fire Fighter Property (FFP) program, a cooperative effort with the U.S. Forest Service, the NFS acquires and reconditions excess equipment which is no longer needed by the federal government. This equipment is then loaned to rural fire districts, which are responsible for maintenance. When no longer needed, the equipment is returned to the NFS and either re-assigned or sold, with the proceeds being returned to the US Treasury or state program. In 2021 there were 984 pieces of FEPP equipment in use by 306 rural fire districts and other emergency response jurisdictions across Nebraska, valued at $105,018,000. In this CWPP Region, there are 136 pieces of FEPP equipment, valued at $12,867,800 and housed in 40 jurisdictions.

These programs allow fire districts to obtain essential fire-fighting equipment at an affordable price. The NFS Fire Shop can provide cooperating fire districts resources to reduce vehicle maintenance costs. This includes securing parts for vehicles and providing complimentary maintenance checks. Mechanics can also provide routine vehicle maintenance at the NFS Fire Shop in Mead or fire districts may use a trusted local mechanic. Two NFS mobile repair units are available to respond to the maintenance needs of cooperating fire districts. These units can provide routine repairs and on-site support for cooperating districts in the event of catastrophic fires.

Aerial Resources
The Wildfire Control Act of 2013 enabled the establishment of Single Engine Air Tanker (SEAT) bases in Nebraska. The SEAT provides critical observation and access for remote areas. Tanker support is vital for locations away from towns and for wildfires located in difficult terrain or spreading quickly. Having a SEAT dedicated strictly to wildfire suppression provides nearby resources for quick initial attack on small fires, keeping them from growing into large catastrophic wildfires.

Permanent SEAT (Type 1) bases enhance fire aviation and initial attack capabilities. SEAT bases are staffed by NFS personnel during the fire season, working with a SEAT on contract to Nebraska through its partners at NEMA. During peak wildfire season (generally July 15-September 15) the state of Nebraska hires a SEAT for at least a 60-day contract period. NEMA pays for the aircraft’s daily rate, and flight time is paid out of the Governor’s Emergency fund. NFS provides the SEAT Manager who directs the entire operation. It is an interagency effort managed by NFS and paid for by NEMA.

Of the five permanent SEAT bases in Nebraska, Valentine’s is the closest to this CWPP Region. The other bases are located in Alliance, Chadron, McCook, and Scottsbluff. In addition, NFS has a mobile SEAT base to support operations at airports without a permanent base. Each base houses LC 95 retardant.
South Central East Community Wildfire Protection Plan

Prior to the onset of fire season, the Wildfire Advisory Group assesses wildfire risk throughout the state. This committee consists of representatives from the NFS, State Fire Marshal’s Office, NEMA, US Forest Service (USFS), and Great Plains Dispatch. They have two in-person meetings per year plus weekly conference calls to discuss wildfire operations, fuel conditions, and resources. The group recommends to NEMA which SEAT base is the best location to station the SEAT plane, and when and for how long the SEAT will be contracted.

The state has a long history of utilizing agricultural aerial applicators for fire suppression. These are an important resource because they are available year around, not just during the peak fire season. Aerial applicators sign up yearly to be part of this program but are not ‘on call’ for wildfire response. Any fire chief who decides one is needed can simply call directly to see if the applicator is available. These aircraft can only carry loads of water or foam, not the preferred and more effective retardant product. Their availability may be limited due to the pilot not being present or out spraying fields. These pilots and the aircraft are not federally ‘carded’ to fly missions on federal land, so they cannot be utilized on USFWS fires.

The NFS Yellow Book (link in Appendix K) contains detailed information about aerial resources, including:

- Contact information for state, federal and private agencies that have emergency suppression resources or can provide technical expertise in the suppression of wildfires
- Aerial Applicator and Foam Retardant Directory
- Deployment procedures and forms needed to order a SEAT
- Map of cooperating aerial applicators and SEAT base locations

Overhead Teams

In major wildfire situations, overhead teams can be called in to help VFDs. State assistance starts with the Wildfire Incident Response Assistance Team (WIRAT). This team is comprised of State Fire Marshals and the NFS. When an Incident Commander (IC) orders the team, the four closest members will respond and assist. This could include scouting the fire, ordering additional resources, establishing a communication plan, operations, communicating with aircraft, or reloading aircraft.

The team does not take over responsibility for the fire. Once a state disaster is declared by NEMA and the governor, a state-level All Hazard Type 3 Team can respond. At this point the fire is beyond the capabilities of the local IC. The team either takes control of the fire or shares the responsibility with the local IC. If the fire grows beyond their capabilities, then the Federal Emergency Management Agency (FEMA) and a Type 1 or 2 team become involved.

Training

The NFS, Nebraska State Fire Marshal’s Office, and NEMA provide wildland fire training through classes in communities across the state, as well as mutual aid schools and State Fire School attended by thousands of people each year.

In addition, the NFS sponsors the Nebraska Wildland Fire Academy, held annually in April at Fort Robinson State Park. Launched as an interagency effort by the NFS and the USFS, the Academy provides opportunities for Nebraska volunteer firefighters to attend nationally recognized wildland fire and incident management training at little or no cost, on a schedule that doesn’t require them to be away from home more than what is already required by their volunteer efforts. It utilizes the expertise of local, state, and federal firefighters to ensure the fire training needs of Nebraska and the surrounding region are met. It also enables local volunteers to enter the national red card system and develop certifications that are recognized across the nation.

Classes cover a variety of topics ranging from beginning to advanced firefighting techniques, Firewise® landscaping and construction, leadership, and fire prevention education. The classes offer flexibility and can be fine-tuned to meet the needs of local fire departments. NFS delivered and sponsored 2,133 course hours in 2020. Wildland fire instructors are based in Ainsworth, Chadron, and Lincoln.
Community-Specific Considerations
Topics pertinent to the entire CWPP region appear in the overview portion of this plan. For planning purposes, each county is considered a community. This part of the document contains elements specific to each county/community. Each county section consists of a ‘Community Profile’ (description and fire hazard) and ‘Infrastructure and Protection Capabilities’ (fire districts, emergency operations, water sources, utilities, roads and bridges, and greatest concerns listed by fire departments). The HMPs contain complete critical infrastructure lists; therefore, these community sections include only a reference to the HMP link in Appendix C. Critical facilities are determined based on the discretion of the jurisdiction.

ADAMS COUNTY
564 sq. miles
2020 population: 31,205

Community Profile
Adams County forms the northwest corner of the CWPP region. It is bounded on the south by Webster County, on the east by Clay County, on the north by Hall County, and on the west by Kearney County. Incorporated municipalities include the county seat of Hastings (pop. 25,152), Ayr (pop. 92), Holstein (pop. 236), Juniata (pop. 1,082), Kennesaw (pop. 1,072), Prosser (pop. 72), and Roseland (pop. 465). Assumption, Hansen, Ingleside, and Pauline are unincorporated communities (no population data available).
Federal lands within the county include 394 acres in two USFWS Waterfowl Production Areas and 1,319 acres of the Greenlief National Guard Training Site. State lands include 165 acres in one WMA and one SRA, and approximately 1,345 acres in school lands. The Little Blue NRD manages 340 acres in three recreation areas. Other than municipal properties, the balance of the land in the county is privately owned. Non-profit conservation lands include a 209-acre Central Platte River tract owned by The Nature Conservancy.

The Little Blue River crosses most of the south end of the county, entering from north of Bladen in Webster County running north and east through Ayr and Pauline before and exiting into Clay County. The west fork of the Big Blue River rises southwest of Hansen and runs south, north, and east before exiting into Clay County south of Trumbull. Most of the county’s woodlands are located along the river and creeks.

Most of Adams County lies within the Loess mixed-grass prairie vegetation zone. Patches of Sandhills mixed-grass prairie extend into the western part of the county. Riparian deciduous forests and strips of lowland tallgrass prairie follow the Little Blue River and many smaller streams. A small area of upland tallgrass prairie exists in the northeast corner of the county. In some areas, eastern redcedar has encroached into grasslands and deciduous woodlands. Agriculture crop fields cover much of the county. Grazing lands occupy most of the rougher terrain.

The WUI areas most at-risk from wildfire are the lands surrounding municipalities and recreational and residential areas along drainages where there are heavy fuels and limited access. The Hastings Fire and Rescue chief named two areas near the east edge of the city as being of particular concern due to multiple structures and a single road in and out. He stated they don’t have a large threat directly in town, but they have readily available and trained resources to provide mutual aid assistance. The Trumbull VFD noted that there are areas in their district with difficult access, rough terrain, one way in/out, and lack of water within effective distance. Areas of concern in Adams County were identified by steering committee members, fire chiefs, or in the statewide Priority Lands analysis; a map is included in Appendix A. All of Adams County lies within the boundaries of the WUI as defined in the introduction to this CWPP.

**Infrastructure and Protection Capabilities**

**Fire Districts and Emergency Management Area**

Volunteer fire districts all or partly within Adams County include Blue Hill, Glenvil, Hastings Rural, Holstein, Juniata, Kenesaw, Lawrence, Roseland, and Trumbull. Hastings Fire and Rescue is a paid, municipal fire department. The county has a full-time emergency manager.

**Water Sources**

Most communities have municipal water systems. Farms and ranches are on wells. The rivers and their larger tributaries are reliable water sources. Windmills can provide water when they are operational. Ponds and stock tanks are located on farms and ranches throughout the county. During drought conditions some of the ponds may not be reliable water sources. The Trumbull VFD listed water sources as a top concern. The Kenesaw VFD listed hydrants as a top concern.

**Utilities/Phone Service**

The Southern PPD and Hastings Utilities provide electric service to Adams County. Both cellular and landline telephone services are available. The Hastings Fire and Rescue chief reported that Verizon is the best provider in Adams County. There are dead zones of cell service near the Little Blue River, and also on the southeast side of the county. Towers are spaced at a maximum distance and sometimes calls will drop in those transition zones. FirstNet is fully built out, and provides at least as good of coverage as Verizon, with nearly the same dead zones. The City of Hastings is currently testing FirstNet for coverage.
Roads and Bridges
None of the fire departments expressed concern about roads or bridges in Adams County. The regional Hazard Mitigation Plan contains complete critical infrastructure lists; see HMP link in Appendix C.

Planning Considerations
According to the HMP’s Adams County Appendix, the Village of Kenesaw has a zoning ordinance that considers the role of the WUI for future development.

Greatest Concerns
The fire departments were asked to list their greatest concerns for their district, shown in the table below:

Community Profile

Clay County is on the north edge of the CWPP region. It is bounded on the west by Adams County, on the south by Nuckolls County, on the east by Fillmore County, and on the north by Hamilton County. Incorporated municipalities include the county seat of Clay Center (pop. 726), Deweese (pop. 65), Edgar (pop. 506), Fairfield (pop. 572), Glenvil (pop. 424), Harvard (pop. 1,087), Ong (pop. 59), Saronville (pop. 35), Sutton (pop. 1,447), and Trumbull (pop. 196). Inland (pop. 91) is an unincorporated community.

Federal lands in Clay County include 6,719 acres in several USFWS Waterfowl Production Areas and about 31,181 acres within the USDA/UNL MARC and the Greenlief National Guard Training Site. State lands include 1,460 acres in six NGPC WMAs, and approximately 80 acres in school lands. Other than municipal properties, the balance of the land in the county is privately owned. Non-profit conservation lands include 1,760 acres in five tracts managed by Ducks Unlimited.

The West Fork of the Big Blue River crosses the northwest corner of the county and the Little Blue River cuts across the southwest corner. The majority of the county’s woodlands are located along these rivers and their tributaries. The eastern three quarters of Clay County lies within the upland tallgrass prairie vegetation zone; the western quarter is in the Loess mixed-grass prairie zone. Strips of lowland tallgrass prairie and riparian deciduous forests follow the Little Blue River and appear in places along other streams. In some areas, eastern
redcedar has encroached into grasslands and deciduous woodlands. Agriculture crop fields cover much of the county.

The WUI areas most at-risk from wildfire are the lands surrounding municipalities and recreational and residential areas along drainages where there are heavy fuels and limited access. Many at-risk areas are located along the Little Blue and the West Fork of the Big Blue Rivers and some of their tributaries, where topography is rough and woody fuels are dense in some places, creating high fire hazard.

The Edgar/Ong fire chief identified two locations of concern in their district: 1) along the Little Blue River where there are multiple structures and rough terrain, and 2) the Village of Ong due to multiple structures, rough terrain, heavy fuels, and approximately 30 uninhabited houses with very tall weeds and grass around the town. The Trumbull VFD noted that there are areas in their district with difficult access, rough terrain, one way in/out, and lack of water within effective distance. MARC listed their main building complex as an area of concern due to multiple structures and heavy fuels. According to the HMP’s Clay County Appendix, Glenvil occasionally experiences small grass fires and is concerned about the risk of a larger event. Areas of concern were identified by steering committee members, fire chiefs, or in the statewide Priority Lands analysis are shown on a map in Appendix A. All of Clay County lies within the WUI boundary as defined in the introduction to this CWPP.

The most significant fire events reported in the county burned 408 acres in 2017 when powerlines sparked a fire during dry conditions and a lightning fire in 2000 which burned 200 acres and caused $28,000 in property damages. A fire in 2013 burned six square miles of grass and cropland, pushed by 45 mph winds. Fires in 2012, near the golf course, reached seven miles wide and was exacerbated by 55 mph winds. A wildfire approached Village of Ong in 2013, and while it did not enter the town, a couple of buildings near town were burned, and people reported illnesses from breathing the fire’s smoke. In addition, there were accidents between vehicles and fire trucks that were responding to this incident, resulting in six injuries requiring hospitalization.

Protection Capabilities and Infrastructure

Volunteer fire districts all or partly within Clay County include Clay Center, Edgar/Ong, Fairfield, Glenvil, Harvard, Hastings Rural, Sutton, and Trumbull. MARC has its own part-time, paid fire department. The county has a full-time emergency manager.

Water Sources

Most communities have municipal water systems. Farms and ranches are on wells. The Little Blue and the West Fork of the Big Blue Rivers and their larger tributaries are generally reliable water sources. Windmills can provide water when they are operational. There are small ponds and stock tanks on farms and ranches throughout the county. During drought conditions many ponds may not be reliable water sources. The Fairfield, Trumbull, and MARC fire chiefs named water sources as a top concern.

Utilities/Phone Service

Electric service is provided by the South Central PPD. Both cellular and landline telephone services are available in the county.

Roads and Bridges

The Fairfield fire chief stated that there are some bridges in their district that may not support equipment weight. The regional HMP contains critical infrastructure lists; see link in Appendix C.

Planning Considerations

According to the HMP’s Clay County Appendix, access to water is a particular concern, as firefighters must drive up to 15 miles to refill their tankers. The county has expressed interest in developing four wells for water access.
for tankers in strategic areas around the county. Also concerning to the county are problems with the ability of firefighters to communicate during operations and residents who inadvertently start fires in shelter belt areas.

The county LEOP has designated evacuation routes, but county officials have some concern that the public may not be aware of what the routes are. The also noted that weight limits on some roads will not support certain types of large fire equipment. The county does not have a WUI Code, and property owners in the county are not encouraged or required to have defensible space around structures. There are no incentive programs for landowners to use ignition-resistant material during construction.

**Greatest Concerns**
The fire departments were asked to list their greatest concerns for their district, shown in the table below:

FILLMORE COUNTY
577 sq. miles
2020 population: 5,551

Community Profile
Fillmore County is on the north edge of the CWPP region. It is bounded on the east by Saline County, on the south by Thayer County, on the west by Clay County, and on the north by York County. Incorporated communities include the county seat of Geneva (pop. 2,136), Exeter (pop. 510), Fairmont (pop. 501), Grafton (pop. 220), Milligan (pop. 258), Ohiowa (pop. 102), Shickley (pop. 309), and Strang (pop. 27). There are no unincorporated communities in the county.

Federal lands in Fillmore County include 3,502 acres in several USFWS Waterfowl Production Areas. State lands include 894 acres in five NGPC WMAs. There are no school lands in the county. The Little Blue NRD manages 400 acres in two recreation areas. Other than municipal properties, the balance of the land in Fillmore County is privately owned.

The West Fork of the Big Blue River dips into and out of the north end of the county from York County. Major creeks include Turkey, School, and Walnut. Most of the area’s woodlands are located along these streams. Nearly all of the county lies within the upland tallgrass prairie vegetation zone. Riparian deciduous forests follow the West Fork of the Big Blue River. Areas of upland deciduous forest are found north and south of Turkey Creek in the central and eastern parts of the county. Agriculture crop fields and grazing lands cover most of the county.

Locations of special concern include population centers adjacent to wildlands where topography is rough and woody fuels are dense in some areas, creating high fire hazard. The areas most at-risk from wildfire are located along the river and major creeks. The Ohiowa fire chief named the Bruning Dam and Lone Star NRD recreation sites as of concern due to rough terrain, one way in and out, and lots of grass and trees with public access. The Shickley VFD listed WMAs/swamps as difficult access issues due to standing water not always being visible from
a truck. The Grafton fire chief said the Blue River and several federal and state wildlife reserves in their area are a concern due to difficult access, rough terrain, heavy fuels, and lack of water within effective distance.

The county emergency manager stated that many fires occur in farm fields, often started by machinery. According to the HMP’s Fillmore County Appendix, “The county’s main wildfire concern is related to crop fires. The majority of the county is used for agriculture and the local planning team noted there are few natural barriers to contain wildfire events. Past events have caused significant damages to crops, livestock, roads, bridges, and power lines.”

Areas of Concern were identified by steering committee members, fire chiefs, or in the statewide Priority Lands analysis are shown on a map in Appendix A. All of Fillmore County’s population centers, dispersed farms and ranches, and wooded areas along the river and streams lie within the boundaries of the WUI as defined in the introduction to this CWPP.

Protection Capabilities and Infrastructure

Fire Districts and Emergency Management Area
The Bruning, Exeter, Fairmont, Geneva, Grafton, Milligan, Ohiowa, Shickley, and Sutton Fire Districts lie all or partly within Fillmore County. The county has a full-time emergency management director.

Water Sources
Most communities have municipal water systems. Farms and ranches are on wells. The West Fork of the Big Blue River and the larger creeks are generally reliable water sources. Windmills can provide water when they are operational. There are small ponds and stock tanks on farms and ranches throughout the area. During drought conditions many ponds may not be reliable water sources. The Grafton, Ohiowa, and Shickley fire chiefs and the county emergency manager noted that lack of water is a top concern.

Utilities/Phone Service
Electric service is provided by The Perennial PPD. Both cellular and landline telephone services are available in the county.

Roads and Bridges
Local officials did not report any specific issues with roads. The Fairmont and Ohiowa fire chiefs stated that there are bridges in their districts that will not support equipment weight. The Milligan VFD noted that they are not aware of specific bridges in their district that will not support equipment weight but did list bridge limits as a potential issue. The regional Hazard Mitigation Plan contains complete critical infrastructure lists; see HMP link in Appendix C.

Greatest Concerns
The fire departments were asked to list their greatest concerns for their district, shown in the table below:

Community Profile

Jefferson County forms the southeast corner of the CWPP region. It is bounded on the west by Thayer County, on the north by Saline County, and on the east by Gage County, and on the south by Kansas. Incorporated municipalities include the county seat of Fairbury (pop. 3,564), Daykin (pop. 160), Diller (pop. 256), Endicott (pop. 123), Harbine (pop. 46), Jansen (pop. 110), Plymouth (pop. 367), Reynolds (pop. 64), and Steele City (pop. 58). Powell (no pop. data available) is listed as an unincorporated community.

There are no federal lands in Jefferson County. State lands include 3,227 acres managed by the NGPC in four WMAs, one SRA, and one SHP. There are approximately 1,440 acres of state school lands. The Lower Big Blue NRD manages 318 acres in three recreation areas. Other than municipal properties, the balance of the land in the county is privately owned.

Most of Jefferson County’s woodlands are located along waterways. The Little Blue River enters the central part of the county from Thayer County and exits into Kansas south of Steele City. Major creeks include Big Indian, Brawner, Buckley, Cole, Coon, Cub, Elm, Little Sandy, Rock, Rose, Silver, School, Spring, Turkey, and Wiley.
The majority of the county lies within the upland tallgrass prairie vegetation zone. Strips of lowland tallgrass prairie, gravelly mixed-grass prairie, and riparian deciduous forests follow the Little Blue River. Areas of upland deciduous forests are scattered throughout the south half of the county and along the Little Blue River and Cub Creek. Agriculture crop fields cover most of the county, except along and southwest of the Little Blue River, where the terrain is rough, and grazing is the primary land use.

The WUI areas most at-risk from wildfire are the lands surrounding municipalities and rural residential and recreational developments along drainages where there are heavy fuels and limited access. NGPC staff noted that the Rock Creek Station SHP sees considerable visitation and wildfire mitigation measures can be implemented to protect this and similar public facilities. Areas of Concern were identified by steering committee members, fire chiefs, or in the statewide Priority Lands analysis are shown on a map in Appendix A. All of Jefferson County’s population centers, rural areas, and wooded waterways lie within the boundaries of the WUI as defined in the introduction to this CWPP.

**Protection Capabilities and Infrastructure**

Fire Districts and Emergency Management Area

Fire districts all or partly within Jefferson County include Alexandria, Daykin, Diller, Endicott-Steele City, Fairbury, Gilead, Janson, Plymouth, Swanton, and Western. The county is part of the Jefferson-Saline Emergency Management Area.

Water Sources

Most communities have municipal water systems. Farms and ranches are on wells. The river and larger creeks are generally reliable water sources. There are small ponds and stock tanks on farms and ranches throughout the county. During drought conditions many ponds may not be reliable water sources. The Swanton and Western VFDs identified water sources as a primary concern.

Utilities/Phone Service

Electric service in Jefferson County is provided by the Norris PPD. Both cellular and landline telephone services are available in the county.

Roads and Bridges

No local officials or fire departments reported any issues with roads. The Western VFD reported that there are a few low tonnage bridges in their district that will not support equipment weight. The regional Hazard Mitigation Plan contains complete critical infrastructure lists; see HMP link in Appendix C.

Greatest Concerns

The fire departments were asked to list their greatest concerns for their district, shown in the table below:

Nuckolls County is located on the south edge of the CWPP region. It is bounded on the west by Webster County, on the north by Clay County, on the east by Thayer County, and on the south by Kansas. Incorporated municipalities include the county seat of Nelson (pop. 431), Hardy (pop. 142), Lawrence (pop. 273), Nora (pop. 20), Oak (pop. 59), Ruskin (pop. 111), and Superior (pop. 1,755). Angus, Bostwick, and Saint Stephens are listed as unincorporated communities.

There are no federal lands in Nuckolls County. State lands include 80 acres in two NGPC WMAs and about 648 acres of state school lands. Other than municipal properties, the balance of the land in the county is privately owned.

The Republican River crosses the southwest corner of Nuckolls County, entering from Webster County southeast of Guide Rock and exiting into Kansas southeast of Superior. The Little Blue River crosses the northeast quadrant of the county, entering from Clay County east of Deweese and exiting into Thayer County southeast of Oak. The eastern three quarters of the county lies within the upland tallgrass prairie vegetation zone, with most of the rest within the Loess mixed-grass prairie. Strips of lowland tallgrass prairie and riparian deciduous forests follow the rivers. Areas of upland deciduous forest lie primarily to the south of both rivers. Agriculture crop fields cover much of the county, with grazing lands occupying some of the rougher terrain. Most woodlands are located along the rivers and streams.

The WUI areas most at-risk from wildfire are the lands surrounding municipalities and rural recreational and residential developments along drainages where there are heavy fuels and limited access. The Edgar/Ong fire chief identified two locations of concern in their district: 1) along the Little Blue River where there are multiple
structures and rough terrain, and 2) the Village of Ong due to multiple structures, rough terrain, heavy fuels, and approximately 30 uninhabited houses with very tall weeds and grass around the town.

According to the HMP’s Nuckolls County Appendix, Ruskin officials indicated that wildfires are a concern due to the risk of spread to the community, which poses risks to residents, property, and agriculture in the surrounding area. They said that field fires are relatively common, and often start due to lightning strikes, farm equipment malfunction, or discarded cigarettes. Specific Areas of Concern were identified by steering committee members, fire chiefs, or in the statewide Priority Lands analysis are shown on a map in Appendix A. All of Nuckolls County’s population centers, rural areas, and wooded waterways lie within the boundaries of the WUI as defined in the introduction to this CWPP.

According to the HMP’s Nuckolls County Appendix, the City of Superior stated that wildfire is mainly a concern for WUI areas near parks and the school. Officials expressed concerns with the difficulty of containing these fires. Their concerns include impacts to local infrastructure and demands on the local water supply.

**Protection Capabilities and Infrastructure**

**Fire Districts and Emergency Management Area**

Ten fire districts lie all or partly within Nuckolls County: Byron, Davenport, Edgar-Ong, Fairfield, Guide Rock, Hardy, Lawrence, Nelson, Ruskin, and Superior. The county has a full-time emergency management director.

**Water Sources**

The larger communities have municipal water systems. Farms and ranches are on wells. The Republican and Little Blue Rivers and their larger tributaries are generally reliable water sources. The Superior and Courtland irrigation canals run on the north and south sides of the Republican River, respectively. Windmills can provide water when they are operational. There are small ponds and stock tanks on farms and ranches throughout the county. During drought conditions many ponds may not be reliable water sources. The Fairfield fire chief named water sources as a top concern for their district.

**Utilities/Phone Service**

Electric service in Nuckolls County is provided by the South Central PPD. Both cellular and landline telephone services are available in the county.

**Roads and Bridges**

The Fairfield fire chief stated that there are some bridges in their district that may not support equipment weight. The regional Hazard Mitigation Plan contains complete critical infrastructure lists; see HMP link in Appendix C.

Saline County forms the northeast corner of the CWPP region. It is bounded on the south by Jefferson County, on the west by Fillmore County, on the north by Seward County, and on the east by Gage and Lancaster Counties. Incorporated municipalities include the county seat of Wilber (pop. 1,814), Crete (pop. 7,099), Dewitt (pop. 488), Dorchester (pop. 568), Friend (pop. 943), Swanton (pop. 82), Tobias (pop. 103), and Western (pop. 230). There are no unincorporated communities in the county.

There are no federal lands in Saline County. State lands include 371 acres in four NGPC tracts and about 138 acres of state school lands. The Lower Big Blue NRD manages 223 acres in two recreational areas. Other than municipal properties, the balance of the land in the county is privately owned.

The Big Blue River runs along the county’s east side. Major creeks include Squaw, Swan, Spring, and Turkey. Most of the county’s woodlands are located along the river and creeks. The majority of the county lies within the upland tallgrass prairie vegetation zone, with strips of lowland tallgrass prairie and riparian deciduous forest along the river. Patches of upland deciduous forest are scattered throughout the county. Agriculture crop fields cover most of the county, with grazing lands occupying the rougher terrain.
South Central East Community Wildfire Protection Plan

The WUI areas most at-risk from wildfire are the lands surrounding municipalities and rural recreational and residential areas along drainages where there are heavy fuels and limited access. The Crete VFD expressed concerns about homes and subdivisions expanding into their district from the Lincoln area. Many have only one-way in or out and have wildland conditions within 20 feet of structures. The DeWitt VFD noted difficult access is an issue along Turkey Creek and the Big Blue River. According to the HMP’s Saline County Appendix, private lands enrolled in the NRCS Conservation Reserve Program near the Village of Western pose a fire concern. “The fire department may not be able to respond to a grass fire soon enough to prevent a major fire, and [there may not be enough] resources available to control the fire.” Areas of Concern were identified by steering committee members, fire chiefs, or in the statewide Priority Lands analysis are shown on a map in Appendix A. All of Saline County’s population centers, rural areas, and wooded waterways lie within the boundaries of the WUI as defined in the introduction to this CWPP.

Protection Capabilities and Infrastructure

Fire Districts and Emergency Management Area
Ten fire districts lie all or partly within Saline County: Crete, Dakin, DeWitt, Dorchester, Friend, Milligan, Swanton, Tobias, Western, and Wilbur. The county is part of the Jefferson-Saline Emergency Management Area.

Water Sources
The larger communities have municipal water systems. Farms and ranches are on wells. The Big Blue River and its larger tributaries are generally reliable water sources. Windmills can provide water when they are operational. There are small ponds and stock tanks on farms and ranches throughout the county. During drought conditions many ponds may not be reliable water sources. The Friend, Swanton, Tobias, and Western VFDs identified water sources as a primary concern.

Utilities/Phone Service
Electric service in Platte County is provided by the Norris PPD. Both cellular and landline telephone services are available in the county.

Roads and Bridges
The Crete fire chief stated that they have bridges that will support brush rigs but not a 3,000 gal. tanker. The Western VFD reported that there are a few low tonnage bridges in their district that will not support equipment weight. The Milligan VFD noted that they are not aware of specific bridges in their district that will not support equipment weight but did list bridge limits as a potential issue. The regional Hazard Mitigation Plan contains complete critical infrastructure lists; see HMP link in Appendix C.

Greatest Concerns

Community Profile

Thayer County is located on the south edge of the CWPP region. It is bounded on the west by Nuckolls County, on the north by Fillmore County, on the east by Jefferson County, and on the south by Kansas. Incorporated municipalities include the county seat of Hebron (pop. 1,410), Alexandria (pop. 173), Belvidere (pop. 51), Bruning (pop. 267), Byron (pop. 80), Carleton (pop. 87), Chester (pop. 426), Davenport (pop. 283), Deshler (pop. 737), Gilead (pop. 40), and Hubbell (pop. 63). There are no unincorporated communities in the county. There are no federal lands in Thayer County. State lands include 1,288 acres in six NGPC WMAs and about 720 acres of state school lands. Other than municipal properties, the balance of the land in the county is privately owned.

Most woodlands are located along streams. The Little Blue River crosses the central part of Thayer County from west to east. Big Sandy Creek crosses the northern part of the county from Davenport to Alexandria. The county lies within the upland tallgrass prairie vegetation zone, interspersed with areas of mixed-grass prairie. Strips of lowland tallgrass prairie, gravelly mixed-grass prairie, and riparian deciduous forests follow the Little Blue River and Big Sandy Creek. Areas of upland deciduous forests are found south of both streams and are scattered throughout the southeast part of the county. Agriculture crop fields cover most of the county, with grazing lands occupying rougher terrain.

The WUI areas most at-risk from wildfire are the lands surrounding municipalities and recreational and residential areas along drainages where there are heavy fuels and limited access. NGPC staff noted that wildfire mitigation measures can be implemented to protect the Meridian WMA headquarters and similar public facilities. Areas of Concern were identified by steering committee members or in the statewide Priority Lands analysis and are shown on a map in Appendix A. All of Thayer County’s population centers, rural areas, and wooded waterways lie within the boundaries of the WUI as defined in the introduction to this CWPP.
According to the HMP’s Thayer County Appendix, “The main concerns regarding grass and wildfires in the county are the difficulty of dousing fires in areas with limited water supply and difficult access into fires in remote locations. In April 2014, a fire fanned by high winds traveled across the county and blocked several roads. Another fire in March 2010 burned many acres of pastureland. Past events have burned over 2,800 acres in the county and have led to one fatality and six injuries. In the past few years there have been several large fires which have required up to 15 fire departments in the surrounding areas to respond.”

The HMP noted that “[The Village of] Chester is concerned about the risks to property and life from grass and wildfires, particularly when fires are spread by high winds. Wind-whipped crop fires have occurred recently close to town...Property owners are not required to have defensible space around their structures, nor are there incentive programs for landowners to use ignition-resistant materials during construction.”

The HMP also stated that the Village of Davenport’s main concern involves field fires during fall harvest and their impacts on the surrounding agricultural land and local economy. In the fall of 2014, there were large fires that came within two miles of the village. One fire consumed more than 640 acres.

**Protection Capabilities and Infrastructure**

**Fire Districts and Emergency Management Area**

Eleven fire districts lie all or partly within Thayer County: Alexandria, Belvedere, Bruning, Byron, Carleton, Chester, Davenport, Deshler, Gilead, Hebron, and Hubbell. The county has a full-time emergency manager.

**Water Sources**

Most communities have municipal water systems. Farms and ranches are on wells. The Little Blue River and its larger tributaries are generally reliable water sources. Windmills can provide water when they are operational. There are small ponds and stock tanks on farms and ranches throughout the county. During drought conditions many ponds may not be reliable water sources.

**Utilities/Phone Service**

Electric service in Thayer County is provided by the Norris PPD. Both cellular and landline telephone services are available in the county.

**Roads and Bridges**

Local officials did not provide specific information on roads or bridges. The regional Hazard Mitigation Plan contains complete critical infrastructure lists; see HMP link in Appendix C.

**Greatest Concerns**

The fire departments were asked to list their greatest concerns for their district, shown in the table below:

WEBSTER COUNTY
575 sq. miles
2020 population: 3,395

Community Profile
Webster County forms the southwest corner of the CWPP region. It is bounded on the west by Franklin County, on the north by Adams County, on the east by Nuckolls County, and on the south by Kansas. Incorporated municipalities include the county seat of Red Cloud (pop. 878), Bladen (pop. 213), Blue Hill (pop. 862), Cowles (pop. 25), and Guide Rock (pop. 196). Rosemont is listed as an unincorporated community.

There are no federal lands in Webster County. State lands include 1,093 acres in four NGPC WMAs and about 1,980 acres of state school lands. The Little Blue NRD manages 262 acres in one recreational tract. Other than municipal properties, the balance of the land in the county is privately owned. Non-profit conservation lands include the 612-acre Willa Cather Memorial Prairie south of Red Cloud, managed by the Willa Cather Foundation.

The Little Blue River crosses the northwest corner of Webster County, entering from Franklin County just east of Campbell and exiting into Adams County northwest of Bladen. The Republican River crosses the entire south end of the county south of Red Cloud, entering from Franklin County east of Riverton and exiting into Nuckolls County east of Guide Rock. Nearly all of the county lies within the Loess mixed-grass prairie vegetation zone. Strips of lowland tallgrass prairie and riparian deciduous woodlands follow the Republican River, with strips of
gravelly mixed-grass prairie north of the river and upland deciduous forests south of the river. Agriculture crop fields cover most of the county north of the river, with more grazing lands present in the rough terrain on the south side.

Locations of special concern include population centers adjacent to wildlands and wooded areas along streams. The Bladen and Campbell fire chiefs identified as areas of concern two chemical storage facilities near each of those towns due to multiple structures, heavy fuels/flammable chemicals, and lack of water within effective distance. The Red Cloud VFD noted that the City of Red Cloud is a concern due to multiple structures. Areas of Concern were identified by steering committee members, fire chiefs, or in the statewide Priority Lands analysis are shown on a map in Appendix A. All of Webster County’s population centers, rural areas, and wooded waterways lie within the boundaries of the WUI as defined in the introduction to this CWPP.

According to the HMP’s Webster County Appendix, the City of Blue Hill “...is concerned about the risk of fire events. The city has experienced several fires in town including in 2000 a fire burned the local grocery store to the ground. The city has expressed concern over the local fire departments capabilities.”

Protection Capabilities and Infrastructure

Fire Districts and Emergency Management Area
Seven fire districts lie all or partly within Webster County: Bladen, Blue Hill, Campbell, Guide Rock, Lawrence, Red Cloud, and Riverton. The county has a full-time emergency manager.

Water Sources
The larger communities have municipal water systems. Farms and ranches are on wells. The rivers and their larger tributaries may be reliable water sources. Windmills can provide water when they are operational. There are small ponds and stock tanks on farms and ranches throughout the area. During drought conditions many ponds may not be reliable water sources. The Bladen, Campbell, and Red Cloud VFDs identified water sources as a top concern.

Utilities/Phone Service
Electric service in Webster County is provided by South Central PPD. Both cellular and landline telephone services are available in the county.

Roads and Bridges
The Bladen and Campbell VFDs stated that there are many bridges in their districts that will not support equipment weight. The regional Hazard Mitigation Plan contains complete critical infrastructure lists; see HMP link in Appendix C.

Greatest Concerns
The fire departments were asked to list their greatest concerns for their district, shown in the table below:

Action Plan

This section of the CWPP addresses risk assessment, fire risk rating, treatment of structural ignitability, prioritization, and risk reduction, and it recommends a plan of action for increasing emergency preparedness. The action plan offers specific preparedness recommendations and describes wildfire risk reduction strategies, fuels mitigation practices, training, education, and maintenance. The final part of this section outlines a monitoring and evaluation process that can be used to track progress and periodically update the plan.

Establish and Implement a Risk Assessment Procedure

Risk assessment is a systematic process for identifying and assessing the range of elements that could lead to undesirable outcomes for a specific situation. Quantitative risk assessments provide a method by which we can calculate risk based on measurements or estimates of various risk components such as likelihood of fire occurrence, intensity of fire should it occur, and susceptibility to fire of the various values being evaluated. Qualitative risk assessment is the application of judgment based in knowledge and experience when assessing wildfire risk, the potential for ignitions and recommendations regarding possible ways to mitigate the risk.  

It is important to understand the meaning of risk and hazard in relation to wildfire as it pertains to this CWPP. **Risk** is the chance or probability of occurrence of fire. **Hazard** is the exposure to risk; in a wildfire situation, those hazards can be related to either the natural or the human-made environment. Natural hazards include fuel type and amount, topography, and weather. Human-made hazards include the limited availability of water, limited access to structures, limited green space around structures, and the ignitability of structures. The capability of firefighting resources will be compromised by the severity of both natural and human-made hazards. The 2021 Little Blue and Lower Blue NRD HMP additionally defines **vulnerability** as susceptibility to injury, death, or damages from a specific hazard, and **impact** as the consequences or effect of a hazard on a community. Conducting a risk assessment helps develop strategies to address areas of concern.

This assessment includes a review of the area’s fire history, fuels/vegetation rating, topographic hazard analysis, weather hazard potential, access, water availability, defensible space, and structural ignitability. The Overview section of this plan contains information about the area’s fire history, climate, weather, fuels/vegetation, and topography. Individual county sections provide details on water sources and access issues. Local fire department equipment lists appear in Appendix G. Defensible space and structural ignitability are addressed in this section of the plan.

Several risk assessment tools are available to help communities and individuals understand, explore, and reduce wildfire risk. The USFS’s [Wildfire Risk to Communities](https://www.fs.usda.gov) website is designed to help community leaders, such as elected officials, community planners, and fire managers. This is the first time that wildfire risk to communities has been mapped nationwide. Headwaters Economics provides another national-scale tool that allows users to run a custom [Wildfire Risk Report](https://www.headwaters.org). On a more local level, the NFS Nebraska Wildfire Risk Explorer website provides wildfire-related resources to Nebraskans. The site includes risk assessment tools, property owner resources, and weather data for homeowners, landowners, natural resources and fire professionals, and community planners.

Further information on risk assessment is available in a USFS Rocky Mountain Research Station technical report, which describes a specific risk assessment process premised on three modeling approaches to characterize wildfire likelihood and intensity, fire effects, and the relative importance of highly valued resources and assets that could be impacted by wildfire.

Wildfire-Related Concerns Identified in HMP by Local Participants

The first step in the assessment process is to identify risks that need to be examined. Looking at wildfire-related concerns identified by local HMP participants is a good place to begin. The 2021 Little Blue and Lower Blue NRD HMP covers all counties in the CWPP region. The HMP identifies the entire planning area as being at 100% risk of...
wildfire. Grass/Wildfire was listed as a top concern by Clay County and its villages of Glenvil and Ong; Fillmore County; the Nuckolls County communities of Ruskin and Superior; the village of Western in Saline County; Thayer County and its villages of Chester and Davenport; and the City of Blue Hill in Webster County.

Section 4 of the HMP, Risk Assessment, thoroughly covers risk history, macro trends including changes in climate (temperature, precipitation, drought frequency), and regional vulnerabilities. It contains a good set of WUI wildfire risk maps by county and notes that Jefferson County has the greatest risk of wildfire in the planning region. The HMP’s individual county appendices drill down to summarize local resources and capacity, prioritization, and identifies mitigation actions at the jurisdictional levels.

Another step that can be taken in zoned counties is to review county zoning plans to see if they address specific considerations for high fire risk areas. If they do not, local planners can recommend adding topics that consider such factors as access, building materials, and building setbacks from canyon rims.

Fire Risk Rating and Ignitability
Homes in both forested and non-forested settings can be at risk from wildfires. Quantitative structure risk ratings can be handled under location-specific plans for incorporated communities. Major components of structural ignitability include roofing materials, walls, windows, and wooden attachments. Most of the CWPP region is rural/agricultural with widely spaced home locations. There is an opportunity to perform structural risk and ignitability analysis and treatment activities at rural residential and recreational home sites at the same time fuels mitigation work is being conducted in these areas.

Overcoming perceptions of WUI fire disasters as a wildfire control problem rather than a home ignition problem, determined by ignition conditions, will reduce home loss. The following graphic illustrates the dual-pronged objectives of reducing the risk of home loss by both reducing the probability of exposure to wildfire and reducing susceptibility to wildfire loss.21

---

Prioritization
The community sections in this document describe the WUI focus areas within each county. These can be further prioritized based on data gathered during risk assessment for individual neighborhoods. Eastern redcedar-encroached deciduous forests along the rivers and their tributaries have high priority for hazardous woody fuels reduction, as do areas with recreational development and rural residential subdivisions. All of the WUI edges of population centers, unincorporated residential developments, and dispersed recreational developments in the CWPP region have high priority for fuels treatment and Firewise® preparation. Further assessments may identify additional priority areas.

Appendix A contains an ‘Areas of Concern’ map depicting the parts of each county considered to be at the highest risk from wildfire. The locations were identified by local fire officials, the steering committee, and the planning team. The sites include interface areas with neighborhoods directly adjacent to open spaces, intermix areas where homes are interspersed with natural fuels, and occluded interface areas where neighborhoods are isolated or surrounded by areas of natural fuels. These areas can be prioritized according to locally identified criteria such as hazardous vegetation, structure density, access, and water availability.

The Assessment Process
Many actions can be taken to reduce the fire potential in both existing housing developments and planned new subdivisions. People can assess the potential of a structure located in a wildland environment to withstand an approaching wildfire without the intervention of firefighting personnel and equipment. Assessments focus on proactive, pre-fire preventative actions rather than reactive fire suppression plans. Several excellent fire hazard assessment methodologies are widely available. Below are excerpts from the National Wildland/Urban Interface Fire Protection Program’s methodology publication:

First, it is important to understand how three ignition sources (radiation, convection, and firebrands) can impact a structure located in a wildland environment and how they affect certain building components—roofs, eaves/overhangs, walls, windows, vents, and attachments. Fire potential can be reduced when building a structure or altering an existing structure by conducting mitigation measures on the structure itself and in the surrounding wildland area. The following is a five-step method for assessing the hazards of a WUI area:

Step 1: Select the area to be evaluated.

Step 2: Select the hazard components to be considered. These can include but are not limited to:
- Vegetative fuel hazards both in and beyond the immediate vicinity of the structure
- Structure density (lot size, structures per lot)
- Slope (steeper slopes are more hazardous)
- Weather patterns (temperature, humidity, winds, drought)
- Fire occurrence (increased fire probability where fires have occurred in the past)

Step 3: Rank the hazard components. Develop or use an existing system to define the significance of each component. The system, though subjective in nature, should be specific and consistent.
- Define a system to rank the hazard level of the components (e.g., low-medium-high or numeric)
- Evaluate and rank each individual component that is included in the assessment
- Develop an overall hazard rating system
- Calculate the overall hazard rating

Step 4: Compile the hazard rankings in a usable format that reveals the relationships between the individual hazards and categories of hazards. Three methods are often used to analyze the data collected:
- A geographic information system can define the hazards components and display each hazard on clear overlays, rather than on a single map, allowing analysis of various combinations of data
South Central East Community Wildfire Protection Plan

- A grid index system references specific points of interest on a map. The coordinates of the grid define the hazard rating of a specific property or area
- A matrix system describes the severity of each hazard for each area within the assessment

**Step 5: Develop future actions**—use the information developed to reduce fire loss potential in the WUI:
- Develop mitigation strategies to improve firefighter and public safety
- Develop fire response/evacuation plans
- Provide reference tools for planners, insurers, bankers, and local code adoption
- Develop region-wide cooperative fire protection agreements
- Perform cost/benefit analyses
- Implement or evaluate existing programs
- Strategically focus fuel reduction projects
- Distribute this information along with public fire safety education materials to educate property owners, local and state governments, and fire-service agencies

**Wildfire Risk Reduction**

The goal of risk reduction is to reduce potential loss of life and property. Understanding that wildfire is inevitable can help communities prepare for wildfires. Fire-adapted communities are knowledgeable, engaged communities where actions of residents and agencies in relation to infrastructure, buildings, landscaping, and the surrounding ecosystem lessen the need for extensive protection actions. This enables people to safely accept fire as part of the surrounding landscape. A successful fire-adapted community approach has the potential to save lives, homes and communities, and millions of dollars in suppression costs annually.

There is a range of actions property owners and managers can undertake to become more adapted to wildfire. In general, the more elements that a community has addressed, the more fire-adapted the community will become. Major elements of a fire-adapted community include vegetation management, ignition-resistant homes, increasing local responders’ understanding of wildfire, cooperation between jurisdictional authorities, and fuels treatments on both private and public lands to reduce hazardous fuels and create fuels buffers.

The requirements and procedures to become recognized as a Firewise® Community require coordination among homeowners. When landowners implement fuels reduction treatments using NFS cost share programs, or if a landowner asks for suggestions, the NFS adheres to established Firewise® standards. Many homeowners who do not reside within an officially designated Firewise® Community have utilized these standards independently. NFS staff is available to help homeowners in areas at-risk from wildfire to establish formal Firewise® Communities.

Homeowners can undertake mitigation measures that can decrease the potential destructive effects a wildfire might have on their property. Some measures are designed to modify the vegetative environment surrounding a structure to decrease potential ignition sources. Others focus on modifying a structure (or changing its location) to make the structure more resistant to ignition. To reduce the risk for the long term, actions need to be maintained over time.

**Common Practices**

- Actively managing vegetation near the home by reducing density, conducting landscaping maintenance, and replacing flammable vegetation with ignition-resistant components. Greater efforts are needed within close proximity of the structure and gradually decreasing efforts beyond that.
- Maintaining structures free of needles, leaves, and other organic debris from decks, roofs, and near the base of exterior walls.
- Increasing ignition resistance of structures by actions such as using ignition-resistant roofing and covering exterior openings of structures, such as attic vents, eaves, soffits, and crawl spaces, with non-flammable wire mesh screening.
- Removing flammable materials from beneath structures and decks.
• Locating firewood, fuel tanks, and propane tanks at a safe distance from structures.

Refer to Appendix J for an expanded list of common practices and a listing of several programs, such as Firewise® and Ready, Set, Go!, available to help homeowners and communities reduce wildfire risks.

Other Wildfire Mitigation Practices
Additional wildfire-related mitigation practices are listed below. Some entities have already implemented one or more of these. Planners may want to periodically review and implement or expand upon them, as appropriate.

• Acquire training and equipment for local fire departments
• Implement woody fuels reduction and defensible space projects
• Establish or expand wildfire prevention and education programs
• Participate in the Firewise® program
• Adopt a wildfire hazard identification and mitigation system (see Appendix J)
• Conduct maintenance to reduce risk (tree care and public landscape maintenance programs)
• Reduce risk through land use planning (landscaping and building ordinances)
• Require or encourage fire-resistant construction (the use of non-combustible materials)
• Incorporate wildfire mitigation into comprehensive planning
• Develop a wildland-urban interface code
• Expand water storage capacity/emergency water supplies/dry hydrants
• Upgrade rural water systems; improve well and water systems

Although funding limitations affect any jurisdiction’s ability to implement some of these practices, identifying them as critical needs helps prioritize them for funding assistance opportunities such as the NFS fire equipment program described earlier in this plan.

Wildfire-Related Mitigation Practices Identified in HMPs by Local Participants
Wildfire-related mitigations selected by CWPP area participants in the HMP included:

**Clay County**
- Glenvil: Glenvil and the local fire department have recently upgraded some equipment, but a new tanker is needed.
- Ong: To mitigate the risks of grass fires and wildfires, the Village follows state burning regulations. Emergency management is currently developing a new notification platform to alert residents of dangers and update an evacuation plan for that community. To mitigate the risk of power outages due to fires, the village plans to install backup power generators for the sewer and water systems in town. The planning team indicated adopting Firewise® programs and projects would set up defensible space for fires.

**Fillmore County**
- In 2012 the county created two ‘DISK’ groups, which are groups of farmers that can disk a break in fields to reduce the fuel for crop fires. The county would like to maintain this program and work with townships, farmers, and others to do this. The county noted that eastern redcedar trees need to be removed throughout the county and rural road ditches need to be cleared of brush and vegetation. They also identified the need to educate farmers on equipment maintenance to prevent fire sparks. Many farms have mobile water tanks they can move from field to field for emergency fire suppression.

**Nuckolls County**
- Ruskin: The village fire department maintains two pumpers and two new NFS tankers. The village recently obtained a generator for the municipal well, which may prove useful during wildfire events. Currently residents are not required or actively encouraged to maintain defensible space around their properties.
- Superior: The city removed dead and dying trees around the city to reduce potential fuel loads. The local fire department has undergone training to respond to grass/wildfire events. The city plans to...
South Central East Community Wildfire Protection Plan

remove trees and shrubs; work with stakeholders to develop a database of vulnerable populations, and the organizations that support them; establish an action plan to improve communication between agencies, to better assist residents and businesses during and following emergencies; and establish interoperable communications; implement water system improvements; and conduct an emergency exercise.

Thayer County

- County level: The local planning team identified the need to bolster the mutual aid agreements in the county to improve available resources. Local farmers also assist by disking fields to prevent spread of fire.
- Chester: The village has taken steps to reduce the amount of tall grass that surrounds the community. They have recently updated some fire suppression equipment, but additional tankers are needed. The village identified becoming a Firewise® Community and water system improvements as ways to reduce overall vulnerability. The village’s zoning ordinance discourages development in the WUI.

Reducing Risk for First Responders

An important part of risk mitigation is reducing the risk to the humans who respond to wildfire. Some of the fire-prone areas shown on the Areas of Concern map in Appendix A are located away from the WUI, where there are few or no structures or other human development. Fire in many of these sites can be beneficial in terms of reducing vegetation/fuels density, improving range and wildlife habitat, and curbing the spread of invasive or aggressive native plant species. Where human life and property will not be immediately threatened by a wildfire, it makes sense to prioritize such areas in terms of ‘contain’ vs. ‘immediately control.’

One example of this type of pre-planning is the public wildlife lands in the region, particularly in those locations associated with Rainwater Basin wetlands. According to NGPC staff, these areas tend to be islands of habitat in a sea of cropland, so there is merit to viewing them as ‘contain only’ sites, unless there are structures needing protection on adjacent private lands. Within such wetlands, there is risk that responding firefighters may get stuck while accessing the interiors of these tracts. The employee recalled a story of a fire rig lost in this manner on one of these sites. Although there were no injuries in the incident, bringing fire equipment into these areas may constitute an unnecessary risk.

Other, non-wetland, sites are often within the landscape context of larger grassland and woodland habitats. In these, there may be minimal risk to WMAs, but where there is facility development on adjacent private or NRD properties, a ‘contain’ policy could be modified to protect the developed sites.

Several fire departments that returned the CWPP survey confirmed that difficult access into sites increases the probability of equipment becoming stuck or damaged and can prevent responders from moving quickly to other locations they may be needed. Pre-identifying ‘contain only’ or ‘modified contain’ sites would help fire departments respond more effectively to wildfires in these areas, while still protecting structures and other human developments.

Recommendations for Increasing Emergency Preparedness

Communication

Having and using a comprehensive communications plan is integral to maintaining smooth operations. Many jurisdictions in Nebraska have identified communications as a major issue when working under a mutual aid scenario. Various responders have different communications hardware, and often these are incompatible with one another. This is more than just a nuisance. Communication is vital to responder safety and to coordinating an effective response to wildfire. It is recommended that all entities in the region establish or review, and regularly update, their local communications plans.
Coordination

Coordination among responders is crucial in any emergency response situation. Local emergency managers must be able to tie in their responses with neighboring and outside assisting jurisdictions. The following opportunities have been identified to address common issues and concerns:

1) To protect firefighters, property owners, and structures, consider developing county-level standards for buildings in WUI areas.
2) Encourage communities to utilize the national Firewise® Communities program to decrease risk.
3) Engage partners such as the NRCS, NGPC, and conservation organizations to implement or expand WUI fuels reduction and thinning on a landscape basis through the use of NFS and other cost share programs.
4) Work with the NFS and other partners to implement a CWPP region-wide public education and awareness program to improve wildfire hazard conditions within the WUI.
5) Encourage VFDs in the CWPP region to continue to participate with the other agencies to facilitate interagency wildland fire training.
6) Cooperate with other agencies and property owners to develop long-term multi-unit, multi-year fuel hazard reduction projects, including prescribed burning.
7) Facilitate VFD monitoring of the federal wildland fire weather system indices.
8) Create a statewide ‘Mutual Aid Guide’ that can be carried in each engine, including the engines operated by the federal and state agencies. This document would show what equipment each department, county, or agency has. A fire chief could then consult the guide to see what each department has and could order it for their fire, if needed.
9) Ensure quick notification and involvement process for assessment and assistance on fires, when needed (i.e., WIRAT, Type 3, FEMA, and Type 1 or 2 teams).

Aerial Support

It is critical to maintain the SEAT program authorized through the Wildfire Control Act of 2013. Having a SEAT dedicated strictly to wildfire suppression during peak fire season provides quick initial attack on small fires, particularly those in difficult terrain, keeping them from growing into large catastrophic wildfires. The NFS SEAT Managers have made the following recommendations:

1) Having additional SEAT Managers throughout the state would increase response times. Currently there are four qualified managers; more would increase program capabilities.
2) Increase the number of aerial applicators within the CWPP region who cooperate with NFS and NEMA to provide aerial fire suppression to requesting fire departments. Having fewer applicators limits available options during wildfires.
3) Sustain or increase the current level of cooperation with adjacent states and their aviation resources. Maintain clear paths of communication to ensure that neighboring jurisdictions are aware of available resources, times of planned contracted aviation availability, and enable the sharing of resources across state borders, when needed. Facilitate sharing managers and help trainees become qualified. Cooperation in sharing information, personnel, and resources will benefit all in creating effective operations.

Maps and Data

Restricted Roads and Bridges: Some county roads and bridges have weight or width limitations, or both, that may inhibit use by emergency vehicles. Planners are urged to work with counties and fire departments to identify and map all roads and bridges, specifically identifying those that are restricted. Making this data available to fire departments and other emergency responders would facilitate route planning. This could also be used to help prioritize fuel treatment areas. Since road conditions constantly change, this information should be monitored locally and updated as needed. The Crete fire district has already begun this process.
Incident Command Staging Areas: These have been identified as an issue in some parts of Nebraska. Local planners can address this by pre-identifying potential staging locations near areas of wildfire concern such as recreation areas and rural subdivisions. Staging areas must be far enough away from a fire to reduce congestion and confusion for incident managers, yet close enough to efficiently provide resources. When a resource is needed, it is deployed from the staging area, with a controlled entry into the hazard zone. Staging areas need to be of sufficient size to accommodate multiple fire crews, engines, tankers, support vehicles, and equipment storage. Sites should have good access, water, and power availability, and be able to accommodate communications needs. The information gathered for potential staging areas in the most at-risk locations can be provided to emergency managers, fire chiefs, and others to help them decide where to establish the staging area for a particular incident.

Equipment: Machinery (other than fire equipment) has proven useful in many wildfire situations. Counties may want to consider adding an inventory of non-fire department resources (such as county road graders) to a centralized document.

Geographic Information Systems (GIS): GIS technology can be incorporated into the action plan. A Global Positioning System (GPS) can be utilized to provide locations of tanks, water supplies, and other useful information in each fire district and made available for hand-held devices. Counties and communities that do not already have this information may want to look into acquiring GIS layers for hydrants, well points, water mains, sewer, housing, infrastructure, and bridge limits. Water hydrant systems at golf courses could be mapped and added to this database. GPS locations of stock tanks and other water sources on public lands could also be provided to emergency responders. Other map data that would be useful includes types and locations of pipelines and pumping stations, power substations, power lines, towers and antennas for air resources to avoid, flammable material storage areas, and overhead water refill access points.

In the past there have been issues with sharing map layers between different programs and applications. Many natural resources agencies, including the NFS, now use Avenza™, a mobile map app that allows users to download geospatial-enabled pdf maps for offline use on a smart phone or tablet, using the device’s built-in GPS to track their location, plot and record location information, measure distance and area, and more. Some VFDs may also use this app, but there currently is no standardized protocol. Creating such standardization over time would likely prove useful.

Increase Fire Response Reporting for Increased Equipment Availability

Comprehensive fire reporting helps VFDs demonstrate a need for fire equipment such as provided by the FEPP, FFP/State Fire Assistance, and Volunteer Firefighter Assistance programs described earlier in this document. Since reporting is voluntary for fire districts, not all fire districts consistently report their wildfire responses to the NFS. Because of this, limited information is available about the locations and sizes of historic wildfires within the CWPP counties. There is a risk that incomplete reporting might imply that there is no pressing need for this type of equipment. This could potentially put the status of the program in jeopardy. In response to this, NFS offers an incentive to VFDs for participation: Only fire departments that report their responses are eligible to apply for this equipment.

Although reporting has increased recently, VFDs are urged to continue stepping up this effort. The information provides data to geographically focus grant assistance on those areas most prone to wildfire. The NFS has a database already in place to facilitate this. Planners and fire departments are urged to work together to gather and report wildfire data to assist fuels mitigation efforts and increase funding opportunities for fire equipment. Departments can report their wildfire responses online. From the NFS home page, www.nfs.unl.edu, go to Programs, Wildland Fire, and navigate to the fire reporting tab. Follow the login instructions the NFS provided to your department (or email trees@unl.edu), then follow the prompts to create the report.
WUI Protection
Prepared communities reduce hazards, protect homes, and increase firefighter safety. Homeowners in WUI areas should be encouraged to establish and expand Firewise® Communities, Fire-Adapted Communities, and Ready, Set, Go! programs across the region. In a wildfire situation, responders often must quickly decide which homes have the best chance of being saved so they can focus their efforts on them. Some Nebraska fire departments have developed ‘triage’ documents to help firefighters quickly assess these homes and neighborhoods. Consider implementing this practice in the CWPP Areas of Concern. Preparation by property owners prior to a wildfire can contribute to firefighter safety and help them protect structures. See Appendix J.

Work with counties and municipalities to evaluate one-way-in/one-way-out subdivisions for potential addition of alternate ingress/egress routes. Estimate costs and identify potential grants or other financial assistance to address these issues.

Zoning ordinances can be strengthened to include provisions to limit new construction in areas such as canyon rims that are at high risk from wildfire. Counties may want to consider both the monetary costs to taxpayers and the danger to fire department personnel responding to wildfires in these areas. At the very least, setbacks from canyon rims, adequate emergency access, and specific Firewise® practices should be considered for implementation in the areas at highest risk. Communities across the planning area can adopt more stringent building codes which may include regulations and requirements to reduce wildfire risk for residents and structures.

Firebreaks and Fuelbreaks
Strategically placed fuelbreaks and firebreaks in the areas most at-risk from wildfire can give firefighters an edge when protecting WUI areas. These two terms are often confused, but it is important to understand the difference.

A fuelbreak (or shaded fuelbreak) is an easily accessible strip of land of varying width (depending on fuel type and terrain), in which fuel density is reduced, thus improving fire control opportunities. The forest is thinned, and remaining trees are pruned to remove ladder fuels. Brush, heavy ground fuels, snags, and dead trees are disposed of, leaving an open, park-like appearance. Fuelbreaks are commonly used to surround a community and slow the spread of a wildfire. Decreasing the fuel load significantly reduces the risk of extreme fire behavior.

Fuelbreaks provide quick access for wildfire suppression. Control activities can be conducted more safely due to low fuel volumes. Strategically located, they break up large, continuous tracts of dense trees, thus limiting uncontrolled spread of wildfire. This can aid firefighters greatly by slowing fire spread under normal burning conditions. However, under extreme conditions, even the best fuelbreaks stand little chance of arresting a large fire, regardless of firefighting efforts. Such fires, in a phenomenon called “spotting,” can drop firebrands ⅛ mile or more ahead of the main fire, causing the fire to spread rapidly. These types of large fires may continue until there is a major change in weather conditions, topography, or fuel type.

Generally narrower than a fuelbreak, a firebreak is a strip of land, 20 to 30 feet wide (or more), in which all vegetation is removed down to bare, mineral soil each year prior to fire season. A firebreak is a discontinuity in vegetation. It may be a gravel road, a river, or a dozer line. A ‘green firebreak’ uses grasses with high moisture content, such as winter rye or winter wheat, to provide a break in the continuity of the fuel. A firebreak, if it is wide enough, will stop the spread of direct flame. However, embers can still be lofted into the air and travel across the line.

It is critical to understand that both firebreaks and fuelbreaks are lines of defense. Homes and developments between the break and the fire may remain vulnerable. Communities are encouraged to identify the best...
locations for vegetation breaks to protect the WUI. Fuelbreaks are most effective when placed along an existing firebreak such as a road. Choosing a site along a road also allows easy access for equipment.

There are multiple methods of creating breaks, including mechanical, mulching, herbicide, grazing, prescribed fire, and dozer lines. Each treatment has pros and cons, and some may be better suited to a particular site than others. When choosing a method, consider topography, potential for erosion and other environmental effects, access, aesthetics, and cost.

Fuelbreaks and firebreaks are most effective when they are regularly maintained. Dead vegetation and re-sprouting trees should be removed during maintenance.

Training and Education
Firefighter Training
All VFDs are encouraged to participate fully in wildland training opportunities provided through the NFS, the State Fire Marshal’s office, and NEMA. Some of the fire departments in the CWPP region are annual participants in the Nebraska Wildland Fire Academies held at Fort Robinson State Park near Crawford and Ponca State Park in Dixon County. These programs are described in the training overview earlier in this document. Those departments that do not currently participate can be encouraged to do so.

Although not all VFDs have mandatory fitness requirements, local departments can be encouraged to participate, both for safety and to lower insurance costs.

Educational Opportunities for Property Owners and the Public
The Firewise® and Ready Set Go! programs offer excellent guidelines for reducing the loss from wildfire for both in-town and rural structures. The NFS ‘Living with Fire’ publications, for both prairie and woodland areas, are also valuable educational tools for property owners. Fire extinguisher inspections and operation training can be offered as part of Firewise® events that participating communities hold annually. Involving local communities in these voluntary programs increases public awareness regarding structure risk mitigation (see Appendix J).

When issuing building permits, county and municipal offices can distribute literature that includes recommended or required setbacks from canyon rims, lists of fire-resistant building materials, and fire-savvy landscaping suggestions. Service groups such as Rotary and Lions, and youth groups such as FFA, also may present opportunities for getting out wildfire planning information.

Public events such as county fairs can be used to provide wildfire awareness education. Workshops and seminars can offer specific ‘how-to’ fire protection information for homeowners and land managers.

Fuels Mitigation Strategies
There are several approaches to reducing wildfire hazard through fuels management. In addition to active participation by property owners in the structural protection programs described above, practices such as prescribed grazing, prescribed fire, and mechanical fuels reduction can work together to provide protection over large areas containing a diversity of terrain and vegetative cover.

Prescribed Grazing
Grazing keeps fine fuels such as grasses in check. But overgrazed pastures are problematic for range and livestock health, as well as for wildlife. Landowners can work with range and wildlife management professionals to develop grazing plans that will benefit livestock while protecting grasslands and wildlife and managing fine fuels to reduce wildfire hazard.

The NRCS and UNL’s Institute of Agriculture and Natural Resources have specialists available to help landowners develop grazing systems that will address these concerns.
Prescribed Fire
Some federal and state agencies, non-profit organizations, and private landowners use prescribed fire as a land management tool. Prescribed fire can be extremely efficient for keeping eastern redcedar encroachment in check on grasslands. In forested settings, prescribed fire is more effective and safer when used to maintain dense woodlands after they have been mechanically thinned. When tree densities are reduced prior to burning, it is easier to keep the fire on the ground, where it cleans up downed woody fuels without killing many live trees. Crown fires are difficult to control, and they kill healthy trees.

One objective for many of these burns is to reduce heavy fuel loads. Land managers in the CWPP region plan multiple prescribed fires of varying size each year, but weather and resources to conduct the burns impact how many they can complete. Some VFDs assist with these efforts by sharing people and equipment to help with the burns when agency or organizational regulations permit. It is recommended that VFDs continue with these cooperative efforts, as well as continuing to participate in the training available to help them do this safely and effectively.

Mechanical Fuels Reduction in High-Risk Wooded Settings
Many high-risk forested settings within the CWPP boundary are found in wooded recreation sites, rural residential neighborhoods, forested or shrubby lands adjacent to population centers, and in cedar-encroached riparian bottoms. Wooded recreational and ‘second home’ residential areas add the hazards of seasonal congestion, limited or difficult access, and structures adjacent to highly flammable vegetation. Mechanical thinning will decrease tree density to healthy levels and reduce eastern redcedar encroachment in deciduous forests while reducing wildfire hazard.

Slash (unusable limbs and treetops left after thinning) can be chipped, mulched, or piled. Slash piles can present a fire hazard. Disposing of them by burning during appropriate winter conditions or during green up periods (i.e. June) where risk of escape is reduced or chipping on-site are acceptable means to mitigate this threat. Chips can help reduce soil erosion in disturbed areas. The chips should be spread, not piled, to allow vegetation to become established in these areas. Piles of chips not only prevent or delay revegetation; they can also be sources of spontaneous combustion.

The cost of mechanical fuels reduction depends on access, terrain, and tree density. Utilization of wood products generated by these treatments has the potential to offset the costs of doing the work. However, presently there is little local commercial market for this material. Researchers are currently working with the NFS to expand markets for wood products.

Because mechanical fuels reduction can be expensive, some agencies and organizations offer cost-share assistance to landowners. These programs are described in the overview section of this plan. It is recommended that private and state forest landowners continue to utilize these resources to maximize the acreage they treat for hazardous woody fuels.

The NFS administers several federal and state grants that provide cost share to landowners to defray the cost of fuels reduction. Information about these programs can be found online at https://nfs.unl.edu/fuels-assistance. Landowners in counties that have a CWPP in place are eligible for these cost share programs.

Fuels Reduction in High-Risk Non-Forested Settings
Fuels management works best when it is conducted on a landscape basis. In addition to reducing woody fuels in forests, it is also important to manage the grass component on both wooded areas and grasslands. Well-planned grazing and prescribed fire can significantly reduce wildfire risk. Fuels treatments are only as effective as their weakest link. Unmanaged ‘islands’ of grass within managed areas pose a significant risk to the managed lands. Cost-share programs can encourage landowners to manage their non-forested lands. Property managers can check with the NRCS for cost share program information.
Another threat in grassland environments is the presence of unmanaged windbreaks intended to protect nearby structures. If those shelterbelts lie within the structures’ Firewise® zones, they pose a direct threat to the buildings and they must be managed. NFS foresters can provide windbreak management recommendations.

Some communities have expressed concerns about fires jumping over highways that are not properly mowed or managed, and areas along railroad rights-of-way. Regular maintenance of these areas, especially during dry conditions, could help address these concerns.

Much of the fuels reduction activity outside forested areas will involve creating defensible space around rural homes and other structures. The same Firewise® guidelines that apply in forested settings also apply in non-forested settings.

**Maintenance**

Reducing hazardous fuels is not a one-time event. Areas that have been treated by any method to reduce fuels must be maintained on a regular basis because the vegetation continues to grow. NFS fuels treatment agreements include a requirement that the work be maintained for a minimum of ten years after the project is completed. Treatment, particularly mechanical fuels reduction, can be costly, so continued maintenance by keeping regrowth in check prolongs the period of hazard abatement and protects the monetary investment made by landowners and the cost-share program.

**Monitoring and Evaluation**

Monitoring and evaluation are important components of any planning document because they provide information on how well the plan is performing and whether it is achieving its stated goals and objectives. This provides guidance for planning future activities and is an important part of accountability to stakeholders and funding organizations. This section of the CWPP provides a proposed plan maintenance schedule; discussion of monitoring considerations; review of evaluation elements including suggested units of measure for assessing activities and projects; and a table summarizing the five-year action plan.

**Schedule**

The maintenance for this plan will be directed by the county boards in the CWPP region and coordinated with local fire officials and resource managers. Counties or their representatives will annually review the plan to evaluate progress, re-evaluate priorities for action items, and recommend updates as needed.

Review of the recommendations will be necessary as various projects or tasks are accomplished and the at-risk areas decline in hazard rating. Review will also be needed as infrastructure needs change or are met. The review team should include representation of stakeholders who participated in the development of this plan.

A complete update of the plan every five years is recommended because infrastructure needs, population, and land use can change, fuels reduction projects may be completed, emergency services in outlying areas may expand, data are updated, and areas of extreme wildfire hazard decline or increase. Counties are urged, when possible, to coordinate this process with their regional HMP updates. By aligning the update schedules of various planning mechanisms, the goals, priorities, and actions identified can more easily be integrated into other plans.

**Monitoring and Evaluation Process**

Continued public involvement is needed to accomplish many of these recommendations. It is important that the process allows for continued collaboration with stakeholders on how best to meet their needs, while at the same time achieving the objectives of this plan. Counties and fire departments can formally or informally monitor progress and coordinate with agency stakeholders who monitor their efforts according to their internal protocol, documenting accomplishments and redesigning strategies as needed.
Annual assessment of the identified tasks is very important to determine whether or not progress is being made. Each participant is encouraged to prepare an after-action report, either per event or annually, to assist in plan maintenance and updates. Units of measure to be considered when updating the plan for the purpose of reporting accomplishments can include, but are not limited to:

1. Number of projects or activities accomplished which aid fire agency/emergency service response time
2. Number of transportation issues resolved that improve road systems for access, ingress/egress
3. Number of water sources added or upgraded to improve firefighting response
4. Number of pieces/types of fire equipment obtained; number of departments that received them
5. Number of firefighters and fire departments receiving training courses; course hours completed
6. Number of properties/acres treated for fuels reduction and type(s) of treatment used
7. Number of new or retrofitted ignition-resistant structures
8. Number of events with prevention message delivery, number of prevention courses attended/conducted, number of news releases or prevention campaigns conducted, and number of prevention team meetings held
9. Number of partners/agencies/groups cooperating on projects and activities
10. Number of properties/acres treated for fuels reduction and type(s) of treatment used
11. Number of properties/acres treated for fuels reduction and type(s) of treatment used
12. Number of new or retrofitted ignition-resistant structures
13. Number of events with prevention message delivery, number of prevention courses attended/conducted, number of news releases or prevention campaigns conducted, and number of prevention team meetings held
14. Number of partners/agencies/groups cooperating on projects and activities
15. Number of properties/acres treated for fuels reduction and type(s) of treatment used
16. Number of new or retrofitted ignition-resistant structures
17. Number of events with prevention message delivery, number of prevention courses attended/conducted, number of news releases or prevention campaigns conducted, and number of prevention team meetings held
18. Number of partners/agencies/groups cooperating on projects and activities
19. Number of properties/acres treated for fuels reduction and type(s) of treatment used
20. Number of new or retrofitted ignition-resistant structures

Each participating agency/organization can assess their activities and projects using units of measure such as those listed above and in Appendix B to determine progress. This plan is not intended to function as a means of bypassing the individual processes and regulations of the participating entities. Each project must adhere to any pertinent local, state, and federal rules. The CWPP is a coordinating document for activities related to fire protection, fuels treatment, information development, and wildfire outreach and education.

Implementing and Updating the Action Plan
Appendix B contains a detailed description of this CWPP’s goals, strategies, objectives, and tactics that can be used to implement this plan. It is highly recommended that planners review the appendix in its entirety when developing specific activities to implement this plan. The comprehensive information is intended to assist participants when they initiate action, evaluate progress, and update the CWPP. It may also aid grant writers in accurately describing CWPP targets and organizing funding assistance requests.

The following table summarizes the CWPP objectives, and the associated tasks needed to achieve each; suggests who might perform the tasks and when, provides benchmarks for evaluation, and identifies opportunities and limitations. When the CWPP is updated at the end of five years, a new action plan can be developed to accommodate new or expand current objectives for the following five years.

Goals, Strategies, Objectives, and Tactics

This appendix is intended to assist planners and grant writers in accurately describing overall CWPP goals, understanding strategies to accomplish them, defining measurable objectives needed to achieve the goals, and to provide examples of tactics that could be used to achieve the objectives. Each objective includes suggested metrics, or performance-gauging tools that can be used to measure success.

Overall CWPP Purpose: Strengthen Community Wildfire Preparedness

Definitions
1. A goal is a broad primary outcome.
2. A strategy is the approach you take to achieve a goal.
3. An objective is a measurable step you take to achieve a strategy.
4. A tactic is a tool you use in pursuing an objective associated with a strategy.

Goal 1: Reduce wildfire risk
Strategy: Reduce the likelihood of fire entering communities, physical impacts and losses, and the negative economic/social impacts by collaborating with stakeholders to define, understand, and address wildfire risks. Suppress unplanned ignitions to protect private property and natural and cultural resources from unacceptable impacts attributable to fire.

Objectives
- Identify wildfire risks (hazards/vulnerability), areas of concern that contain these risks, and a range of mitigation measures (Metrics: # risks, # locations, and # measures identified). Tactics:
  - Identify a baseline by considering historic data such as causes, frequency, and probability of wildfire
  - Use input from local responders and agency personnel to map specific areas at risk from wildfire
  - Utilize data from multiple sources to help identify appropriate fuels reduction practices for local at-risk areas
- Assess risks in the mapped areas (Metrics: Rating system implemented, prioritized list created). Tactic:
  - Devise a rating system to assess the degree of risk (i.e., High-Medium-Low) and establish hazard reduction priorities
- Mitigate risks: Implement mitigation measures to create defensible space and reduce structural ignitability (Metrics: # practices implemented, # projects implemented, # acres/structures protected). Tactics:
  - Use cost share programs and coordinate with partners to assist WUI landowners implementing mitigation activities such as mechanical fuels treatment, thinning, prescribed fire and prescribed grazing
  - Coordinate among adjacent large ownerships and/or public lands to protect communities on a landscape scale

Goal 2: Support emergency response
Strategy: Collaborate to assess local preparedness and capabilities, identify gaps and needs, and develop ways to enhance preparedness and response capability and improve firefighter readiness and safety.

Objectives
- Assess local response capacity (Metrics: # of VFD survey responses; list of items from HMP review, # of needs/gaps identified). Tactics:
  - VFD survey; review HMP data; consult with local officials
- Enhance local response capacity (Metrics: # pieces of equipment added or updated, # of VFDs able to monitor indices, # aerial applicators participating, # restricted roads/bridges mapped, # evacuation routes/staging locations identified, # of treatments conducted to improve access, # of water resources improved or added, # of WUI guidelines added). Tactics:
  - Increase and update equipment via VFD assistance programs
  - Facilitate VFD monitoring of the federal wildland fire weather system indices
  - Aerial support: Recruit and train additional aerial applicators and SEAT Managers
  - Roads/transportation:
    - Obtain critical infrastructure GIS layers
    - Map restricted roads/bridges
    - Identify evacuation routes, potential staging locations
    - Evacuation route treatments to improve access, including roads, development ingress/egress
  - Community planning:
    - Expand/improve water resources
South Central East Community Wildfire Protection Plan

- To protect firefighters, property owners, and structures, consider developing county-level standards for buildings in WUI areas
  - WUI guidelines or regulations for new construction
  - Guidelines for retrofitting existing structures
- Increase firefighter readiness and safety (Metrics: # of trainings offered, # VFDs participating, # of firefighter training hours completed). Tactic:
  - Provide wildland fire training to VFDs
- Enhance communication among fire management agencies (Metrics: # of agreements in place and current, # of VFDs trained in radio channel use, # of partners coordinating fire management programs, statewide mutual aid guide created/updated, quick notification process implemented). Tactics:
  - Ensure all relevant Memorandums of Understanding (MOUs) and Mutual Aid Agreements (MAAs) are in place and current
  - Train fire departments in the use of the V-TAC and UHF mutual aid radio channels; educate fire departments and 911 dispatchers about notifying assisting mutual aid departments which V-TAC or UHF channel will be used when arriving at an event
  - Partner with landowners, land managers, fire personnel, natural resources agencies, and other organizations to incorporate local concerns and objectives into fire management programs
  - Create a statewide Mutual Aid Guide
  - Ensure quick notification and involvement process for assessment and assistance on fires, when needed (i.e., Wildfire Incident Response Assistance Team, Type 3 Team, FEMA, and Type 1 or 2 teams)

**Goal 3:** Promote an informed and active citizenry for wildfire preparedness

*Strategy:* Partner with natural resources agencies, schools, prescribed fire organizations, and other groups to implement a CWPP region-wide public awareness and engagement program to improve wildfire hazard conditions within the WUI.

Educate homeowners, neighborhoods, schools, municipalities, and others about wildfire risks and engage them in community preparedness actions. Ensure that outreach targets a broad audience, including the agricultural community, schools, landowners, home and business owners, recreationists, and the general public; identify specific ways to address this.

**Objectives**

- Increase local knowledge of wildfire risk and prevention (Metrics: # handouts or news releases distributed, # of events or activities held, # of people reached) Tactic:
  - Work with partners to establish a region-wide public awareness program
  - Use brochures/handouts and news releases to increase wildfire awareness and publicize mitigation activities
  - Offer mitigation/prevention-focused workshops, seminars, school presentations/activities
- Engage stakeholders in preparedness activities that promote the use of defensible space to reduce fuel loads to protect communities and resources (Metrics: # landowners creating defensible space, # community programs established/expanded). Tactic:
  - Introduce and encourage participation in programs such as Firewise, Fire-Adapted Communities, and Ready-Set-Go, as well as WUI fuels treatment programs

**Goal 4:** Restore fire-adapted ecosystems

*Strategy:* Work with partners to restore native fire-adapted ecosystems to increase community protection, enhance firefighter safety, and improve habitat health.

**Objectives**

- Encourage land managers to reduce heavy understory fuels in woodlands (Metrics: # land managers reached, # of landowners implementing fuels reduction practices, # of acres treated). Tactic:
  - (See tactics listed under Goal 1, Objective 3)
- Encourage land managers to control non-native invasive plant species and to actively manage prolific and aggressive native species (Metrics: # land managers reached, # of landowners implementing control/management practices, # of acres treated). Tactic:
  - Educate land managers in plant identification and control measures
  - Use cost share programs to defray landowner costs
- Encourage land managers to use native plant species when restoring ecosystems (Metrics: # land managers reached, # land managers using native species). Tactic:
  - Educate land managers about the benefits of using native plant species
  - Help land managers locate and obtain appropriate native plant species
  - Safely incorporate prescribed fire into historically fire-adapted ecosystems, using trained personnel and standard operating procedures (Metrics: # acres treated safely). Tactic: Offer fire training
Goal 5: Enhance post-fire recovery
Strategy: Work with partners to quickly assess and stabilize burned lands to reduce erosion and protect property.

Objective
- Enable rapid assessments of burned lands and the implementation of stabilization techniques. (*Metrics:* # trainings offered, # acres stabilized). *Tactics:*
  - Provide training on burned area assessment
  - Provide financial assistance

Goal 6: Establish and implement a CWPP monitoring and evaluation process
Strategy: Strengthen CWPP effectiveness by working with stakeholders to evaluate progress and update regularly.

Objectives
- Annually evaluate progress in implementing the CWPP and recommend changes as needed. (*Metrics:* Checklist and framework created, # projects/activities implemented). *Tactic:*
  - Create a review checklist and framework for providing recommendations
- Conduct monitoring of selected projects and activities to assess progress and effectiveness (*Metrics:* Process established, # of projects/activities/acres monitored). *Tactic:*
  - Determine number of assessments needed and establish a process for choosing and evaluating them
- Improve grant eligibility (*Metric:* # of successful grant applications). *Tactic:*
  - Regularly review and update CWPP and other planning documents to ensure they reflect current activities and needs

Fuel Models for the South Central East CWPP Region
Grass-Shrub Fuel Type Models (GS)

The primary carrier of fire in the GS fuel models is grass and shrubs combined; both components are important in determining fire behavior.

All GS fuel models are dynamic, meaning that their live herbaceous fuel load shifts from live to dead as a function of live herbaceous moisture content. The effect of live herbaceous moisture content on spread rate and intensity is strong and depends on the relative amount of grass and shrub load in the fuel model.
**GR1 (101)**

*Short, Sparse Dry Climate Grass (Dynamic)*

**Description:** The primary carrier of fire in GR1 is sparse grass, though small amounts of fine dead fuel may be present. The grass in GR1 is generally short, either naturally or by grazing, and may be sparse or discontinuous. The moisture of extinction of GR1 is indicative of a dry climate fuelbed, but GR1 may also be applied in high-extinction moisture fuelbeds because in both cases predicted spread rate and flame length are low compared to other GR models.

<table>

</tr>
<tr>
<td>Extinction moisture content (percent)</td>
<td>15</td>
</tr>
</tbody>
</table>

![Graphs showing rate of spread and flame length vs. midflame wind speed](image)
**GR2 (102)**

*Low Load, Dry Climate Grass (Dynamic)*

**Description:** The primary carrier of fire in GR2 is grass, though small amounts of fine dead fuel may be present. Load is greater than GR1, and fuelbed may be more continuous. Shrubs, if present, do not affect fire behavior.

- Fine fuel load (t/acre): 1.10
- Characteristic SAV (ft-1): 1820
- Packing ratio (dimensionless): 0.00158
- Extinction moisture content (percent): 15
South Central East Community Wildfire Protection Plan

GR3 (103)

*Low Load, Very Coarse, Humid Climate Grass (Dynamic)*

![GR3 (103) Low Load, Very Coarse, Humid Climate Grass (Dynamic)](image)

**Description:** The primary carrier of fire in GR3 is continuous, coarse, humid-climate grass. Grass and herb fuel load is relatively light; fuelbed depth is about 2 feet. Shrubs are not present in significant quantity to affect fire behavior.

**GR4 (104)**

*Moderate Load, Dry Climate Grass (Dynamic)*

**Description:** The primary carrier of fire in GR4 is continuous, dry-climate grass. Load and depth are greater than GR2; fuelbed depth is about 2 feet.

<table>
<thead>
<tr>
<th>Characteristic</th>

<td>15</td>
</tr>
</tbody>
</table>

---

**GR6 (106)**

*Moderate Load, Humid Climate Grass (Dynamic)*

**Description:** The primary carrier of fire in GR6 is continuous humid-climate grass. Load is greater than GR5 but depth is about the same. Grass is less coarse than GR5.

- Fine fuel load (t/ac) 3.5
- Characteristic SAV (ft-1) 2006
- Packing ratio (dimensionless) 0.00335
- Extinction moisture content (percent) 40

---

**Graphs:**

Two graphs showing the relationship between midflame wind speed and rate of spread. The graphs illustrate how different fuel moisture levels affect the rate of spread at various wind speeds. The y-axis represents the rate of spread (in cm/h), while the x-axis represents the midflame wind speed (in m/h). The graphs are color-coded to represent different fuel moisture levels, with each line indicating the spread for a specific moisture condition.
South Central East Community Wildfire Protection Plan

**GR8 (108)**

*High Load, Very Coarse, Humid Climate Grass (Dynamic)*

**Description:** The primary carrier of fire in GR8 is continuous, very coarse, humid-climate grass. Load and depth are greater than GR6. Spread rate and flame length can be extreme if grass is fully cured.

- Fine fuel load (t/ac): 7.8
- Characteristic SAV (ft-1): 1302
- Packing ratio (dimensionless): 0.00316
- Extinction moisture content (percent): 30
Timber-Understory Fuel Type Models (TU)

The primary carrier of fire in the TU fuel models is forest litter in combination with herbaceous or shrub fuels. TU1 and TU3 contain live herbaceous load and are dynamic, meaning that their live herbaceous fuel load is allocated between live and dead as a function of live herbaceous moisture content. The effect of live herbaceous moisture content on spread rate and intensity is strong and depends on the relative amount of grass and shrub load in the fuel model.
TU1 (161)

Low Load Dry Climate Timber-Grass-Shrub (Dynamic)

Description: The primary carrier of fire in TU1 is low load of grass and/or shrub with litter. Spread rate is low; flame length low.

- Fine fuel load (t/ac) 1.3
- Characteristic SAV (ft-1) 1606
- Packing ratio (dimensionless) 0.00885
- Extinction moisture content (percent) 20
Timber Litter Fuel Type Models (TL)

The primary carrier of fire in the TL fuel models is dead and down woody fuel. Live fuel, if present, has little effect on fire behavior.
TL2 (182)

Low Load Broadleaf Litter

Description: The primary carrier of fire in TL2 is broadleaf (hardwood) litter. Low load, compact broadleaf litter. Spread rate is very low; flame length very low.

<table>

<td>25</td>
</tr>
</tbody>
</table>

[Graphs showing rate of spread and flame length versus midflame wind speed.]
**TL3 (183)**

*Moderate Load Conifer Litter*

**Description:** The primary carrier of fire in TL3 is moderate load conifer litter, light load of coarse fuels. Spread rate is very low; flame length low.

- Fine fuel load (t/ac) 0.50
- Characteristic SAV (ft-1) 1532
- Packing ratio (dimensionless) 0.02630
- Extinction moisture content (percent) 20

![Graphs showing rate of spread and flame length vs. midflame wind speed]
**TL6 (186)**

*Moderate Load Broadleaf Litter*

**Description:** The primary carrier of fire in TL6 is moderate load broadleaf litter, less compact than TL2. Spread rate is moderate; flame length low.

- Fine fuel load (t/ac) 2.4
- Characteristic SAV (ft-1) 1936
- Packing ratio (dimensionless) 0.02296
- Extinction moisture content (percent) 25

Survey Responses from Adams County Fire Departments

Volunteer fire districts all or partly within Adams County include Blue Hill, Glenvil, Hastings Rural, Holstein, Juniata, Kennesaw, Lawrence, Roseland, and Trumbull. Hastings Fire and Rescue (municipal department) is the only paid fire department in the county. The following departments returned the survey:

Department Name: Hastings Fire & Rescue (paid department)
Counties: Adams
Street/Mailing Address: 1313 N Hastings Ave., Hastings, NE 68901
Dept. Phone: 402-461-2350 Dept. Email: bstarling@hastingsfire.org
Chief: Brad Starling; 402-984-0567, 402-461-2351; bstarling@hastingsfire.org

1. **Type 1** Structural: 1,000 1,250 GPM, 300 1,000 gal. capacity, four crew members  
1. **Type 2** Structural: 500 1,000 GPM, 300 1,000 gal. capacity, three four crew members  
3. **Type 6:** Wildland: 50 GPM, 150 gal. capacity, two crew members

**Tenders** *(Tactical Tenders: 4x4, 6x6, 8x8 all-wheel drive)*

1. **T-2 (tactical):** 250 GPM pump, 1,000 750 gallon capacity, 2 crew members, 6x6

**Other**

2. Equipment trucks: both 3,000 gal. with 300 GPM pumps  
1. Other (Describe): Rescue truck

**Equipment housed away from main barn?** No

**Have you identified any areas in your district that you are more concerned about than others if a wildfire starts nearby?** Yes

**Location 1:** Little Blue River, Nuckolls County, in part of our district  
**Issues:**

- Multiple structures  
- Rough terrain  
- Other:

**Location 2:** Village of Ong in Logan Township  
**Issues:**

- Multiple structures  
- Rough terrain  
- Heavy fuels  
- Other: Approx. 30 uninhabited houses with very tall weeds & grass around the complete town.

**Bridges that won’t support equipment weight:** No

**GIS layer & contact info:** Tim Lewis, Clay Co. EM, 402-224-0199, tim.lewis@claycountynebraska.org

**Greatest concerns:** Reaching farm structures out of the city limits

**Rank:**  
2. **Housing**  
1. **Infrastructure**
South Central East Community Wildfire Protection Plan

5 Bridge limits
3 Hydrants
4 Other water sources

Comments: Our department works very well with both mutual aid groups that we belong to. We just need more members.

Survey Responses from Saline County Fire Departments

Ten fire districts lie all or partly within Saline County: Crete, Dakin, DeWitt, Dorchester, Friend, Milligan, Swanton, Tobias, Western, and Wilbur. The following departments returned the survey:

Department Name: Crete VFD (from 1/17/2020 survey)
Counties: Saline, Seward, Lancaster
Street/Mailing Address: 210 East 14th St., Crete, NE 68333
Dept. Phone: 402-826-3473 Dept. Email: tod.allen@crete.ne.gov
Chief: Tod Allen; 402-560-6240; 402-826-3473; tod.allen@crete.ne.gov
Asst. Chief: James Yost; 402-418-1854, 402-826-3473; james.yost@crete.ne.gov
Secretary: Amber Madigan; 402-719-339-8182, 402-826-3473; amber.madigan@crete.ne.gov
Treasurer: Courtney Marcelino; 402-430-3327; 402-826-3473; Courtney.marcelino@crete.ne.gov

Personnel
40 Vol.:

MAD(s): All of Saline County, Seward County, all of Lancaster County except the city of Lincoln
Other MA agreements: Gage County

Equipment

Engines
1 Type 1 Structural: 1,000 GPM, 300 gal. capacity, four crew members
2 Type 2 Structural: 500 GPM, 300 gal. capacity, three crew members
2 Type 6: Wildland: 50 GPM, 150 gal. capacity, two crew members

Tenders
(Tactical Tenders: 4x4, 6x6, 8x8 all-wheel drive)
2 T-1 (tactical): 250 GPM pump, 2,000 gallon capacity, 2 crew members

Other
0 Road Dept. Equip. (describe):

Have you identified any areas in your district that you are more concerned about than others if a wildfire starts nearby? Yes
Location: (will be sending map)
Issues:

x Other: We have a lot of homes moving out from Lincoln into our area and MA areas. We are working on maps right now. I assume you are not worried about cities? We have a lot of subdivision moving out from Lincoln. Many have only one-way in or out and have wildland conditions within 20 feet of structures.

Bridges that won’t support equipment weight: Yes. This is an unclear question. We have bridges that will support brush rigs but not a 3,000 gal. tanker. We are submitting a map.

GIS layer & contact info: No. We are looking to partner with the local university to see if we can get this generated via a class project.

Greatest concerns: We are mapping potential fire paths at this time. These are paths that would allow a wildfire to travel more than 2 miles. Beyond that, the wildland urban interface is our biggest problem.

South Central East Community Wildfire Protection Plan ■ DRAFT 2022 111
Survey Responses from Thayer County Fire Departments

Eleven fire districts lie all or partly within Thayer County: Alexandria, Belvedere, Bruning, Byron, Carleton, Chester, Davenport, Deshler, Gilead, Hebron, and Hubbell.

None of the Thayer County fire departments returned the survey, but the local HMP contained the following information in its Thayer County Appendix for the Village of Davenport:

Davenport’s main concern involves field fires during fall harvest and their impacts on the surrounding agricultural land and local economy. In the fall of 2014, there were large fires that came within two miles of the village. One fire consumed more than 640 acres. The village has two pickups with 300-gallon tanks and six fire engines. The village custodian is tasked with any debris cleanup following fire events. To address this hazard, Davenport would like to improve its civil service capabilities. The department has 26 volunteer firefighters.
Information from Webster Co. LEO, Annex F:

19  
Vol.: (2 of the 19 are EMTs only)

**MAD(s):** Hastings Area MA, State Line MA

**Equipment**  
**Engines**  
2  Type 4: Wildland: 50 GPM, 750 gal. capacity, two crew members  
**Tenders**  
(Tactical Tenders: 4x4, 6x6, 8x8 all-wheel drive)  
2  S-3 (support): 200 GPM pump, 1,000 gallon capacity, 1 crew member  
**Other**  
2  Equipment trucks: 1-pumper, 1,000 GPM, 750 gal. capacity, 2 crew members; and 1-pumper tank, 1,000 GPM, 2,000 gal. capacity, 2 crew members

**Equipment housed away from main barn?** No

Have you identified any areas in your district that you are more concerned about than others if a wildfire starts nearby?  
Yes  
**Location1:** CPI Anhydrous Plant, Glenwood Township, R11W, Sec. 22. From Bladen, 2 miles south and then 2 ½ miles east on Hwy. 4, north side of highway.  
**Issues:**  
x  Other: Many anhydrous tanks

**Location2:** Norder’s Supply, Harmony Township, R12W, Sec. 22. 490 Highway 4, Bladen, NE. From Bladen, 2 miles south and then 3 miles west, north side of road.  
**Issues:**  
x  Other: Agricultural chemicals

**Bridges that won’t support equipment weight:** Yes. Too many to list individually, but most are posted with weight limits.

**GIS layer & contact info:** No

**Greatest concerns:** Manpower

**Rank:**  
2  Housing  
3  Infrastructure  
4  Bridge limits  
5  Hydrants  
1  Other water sources

**Department Name:** Campbell Rural Fire Protection  
**Counties:** Franklin, Kearney, Webster  
**Street Address:** 712 Broad St.  
**Mailing Address:** PO Box 337, Campbell, NE 68932
South Central East Community Wildfire Protection Plan

Chief: Ron Pankoke; 402-984-4730c, 402-756-8435h
Ass’t. Chief: Greg Choquette; 402-469-1968c, 402-756-8353h
Sec/Treas.: Jenny Pankoke

Personnel
28 Vol.: 

MAD(s): Hastings Area MA, Franklin Co. MA, Kansas-Nebraska State Line MA
Other MA agreements: Campbell and Bladen Fire Departments are working together because of volunteer fireman and EMT issues. We also cover Upland for ambulance services.

Equipment

Engines
2 Type 1 Structural: 1,000 GPM, 300 gal. capacity, four crew members
2 Type 5: Wildland: 50 GPM, 400 gal. capacity, two crew members

Tenders
(Tactical Tenders: 4x4, 6x6, 8x8 all-wheel drive)
1 S-2 (support): 200 GPM pump, 2,500 gallon capacity, 1 crew member
1 S-3 (support): 200 GPM pump, 1,000 gallon capacity, 1 crew member

Other
1 Equipment trucks trailer
2 Other (describe): ambulances
1 Other (describe): chief vehicle

Equipment housed away from main barn? No

Have you identified any areas in your district that you are more concerned about than others if a wildfire starts nearby?
Yes (Both on south edge of Campbell in Franklin Co.)

Location 1: T4N R13W Sec. 25, Hall’s Oil, Inc. Fuel retail location with about 2000,000 gal. of gas and diesel on hand, about 20,000 gal. of propane, and a warehouse full of oil and supplies. The closest water hydrant is across Highway 4.

Issues:
- Multiple structures
- 1 way in/out
- Heavy fuels
- Lack of water within effective distance

Location 2: T4N R13W Sec. 25. CPI Grain is a local elevator with grain and fuel storage. Closest hydrant is across Highway 4.

Issues:
- Multiple structures
- Heavy fuels
- Lack of water within effective distance

Bridges that won’t support equipment weight: Yes. The bridges out in the county roads are not in good enough shape to support our tanker trucks.

GIS layer & contact info: Yes, Ron Pankoke, 402-984-4730.

Greatest concerns: Being able to get to water fast enough to rural areas and having enough personnel to operate the trucks.

Rank:
5 Housing
4 Infrastructure
2 Bridge limits
3 Hydrants
1 Other water sources – getting water to rural areas

Comments: We are having a problem with getting active personnel, especially EMTs.

3 Bridge limits
4 Hydrants
1 Other water sources

The Blue Hill Fire Department did not return the survey, but the local HMP contains the following information in its Webster County Appendix:

The City of Blue Hill “...is concerned about the risk of fire events. The city has experienced several fires in town including in 2000 a fire burned the local grocery store to the ground. The city has expressed concern over the local fire departments capabilities. The local fire department has 20 volunteer firefighters, with 2 pumers, 2 quick attacks, a new ambulance, and 2 tank trucks. One pumper has recently been upgraded with a bigger hose. The city is building an addition on fire station to allow for more space for equipment.”

South Central East Community Wildfire Protection Plan

Have you identified any areas in your district that you are more concerned about than others if a wildfire starts nearby? □ Yes □ No

If yes, please describe where and why:
Township _____  Range _____  Section _____  Local Name: ________________________________
Location Description:

Issues (check all that apply):
□ Multiple Structures
□ Difficult Access
□ Rough Terrain
□ One way in and out
□ Heavy fuels
□ Lack of water within effective distance
□ Other (specify):

________________________________________________________
________________________________________________________

Additional areas:
Township _____  Range _____  Section _____  Local Name: ________________________________
Location Description:

Issues (check all that apply):
□ Multiple Structures
□ Difficult Access
□ Rough Terrain
□ One way in and out
□ Heavy fuels
□ Lack of water within effective distance
□ Other (specify):

________________________________________________________
________________________________________________________
Are there bridges in your jurisdiction that won’t support equipment weight? □ Yes □ No
If yes, please describe:

Are there other areas in your jurisdiction with high home density, infrastructure or other resources at high risk, or populated areas with one way in/out? □ Yes □ No
If yes, please describe:

What are your greatest concerns if a wildfire were to start in or enter your jurisdiction?

Does your jurisdiction have GIS layer(s) that show housing, infrastructure, bridge limits, hydrants and other water sources (other than the county assessor’s GIS information)? □ Yes □ No
If yes, please provide contact information:
Name: __________________________
Phone: __________________________ Email: __________________________

Which of these is of greatest concern in your jurisdiction?
(Please rank 1 to 5 with 1 being most important)

_____ Housing
_____ Infrastructure
_____ Bridge limits
_____ Hydrants
_____ Other water sources

Is there anything else you think we should know? __________________________

Outreach Documents

County Boards and Emergency Managers

(sent via e-mail 7/29/2021 and 7/26/2021)

To: County Boards
cc: Emergency Managers
From: Sandy Benson, Nebraska Forest Service
Subject line: Community Wildfire Protection Plan Steering Committee Designation - Please respond!
Attachments (2): Background info sheet; Statewide CWPP Map

County Boards:
My name is Sandy Benson, and I am a fuels management specialist with the Nebraska Forest Service (NFS). I work with communities and landowners in wildfire preparation efforts throughout the state. The NFS is developing Community Wildfire Protection Plans (CWPPs) statewide to help obtain funding for wildfire mitigation, maximize safety, bolster communications between local and state resources, and help communities understand the evolving role fire plays in Nebraska’s landscape. Landowners in counties that have a CWPP in place are eligible to apply for a fuels reduction cost-share program that helps defray the costs of protecting structures and emergency access routes from wildfire.

Your county is in Nebraska’s South Central East regional planning area, and we invite you to designate an individual to participate on the steering committee to help identify local issues important to your citizens. Some counties have designated emergency management staff. Others have selected fire department personnel or other individuals with expertise in wildfire response. Due to the large size of the planning area and everyone’s busy schedules, no travel will be required, and we estimate a maximum of four hours of committee members’ time will be needed over the course of the entire planning process, which should take less than a year. Committee work is designed to occur via email and teleconference.

The attached document* explains the details of this process. County boards will be invited to review and provide feedback on the draft plan. When it is finalized, county boards will have an opportunity to adopt it.

It is important that local officials are aware of the planning process and we welcome your county’s participation. Most county boards are pleased to learn that there is no cost associated with CWPP preparation. The primary reasons for having a CWPP are:

- A CWPP is a wildfire-specific resource that coordinates with local emergency and hazard mitigation plans
- Lands within CWPP regions are eligible for cost-share funding

If you have questions, please contact me at 402-684-2290 or sbenson4@unl.edu. If you would like to speak to me by phone during your board meeting, please let me know the date and time so I can be available.

*Background Information:
The Nebraska Forest Service (NFS) is in the early stages of preparing a Community Wildfire Protection Plan (CWPP) for the South Central East region of Nebraska, which includes Adams, Clay, Fillmore, Jefferson, Nuckolls, Saline, Thayer, and Webster Counties. This wildfire-specific resource coordinates with local emergency plans and allows local landowners and others to apply for federal and state cost-share funds for vegetative fuels treatment (such as eastern redcedar reduction) and other hazard mitigation efforts within the CWPP region. There is no cost to counties.

What is a CWPP?
A CWPP is one of the most successful tools for addressing the challenges and responsibilities that arise from living in a wildfire-prone environment. CWPPs specifically define wildfire risk areas within and adjacent to communities, the measures necessary to mitigate those risks, and a plan of action to implement these measures.

The collaborative CWPP process is effective in maximizing coordination and communication between emergency response agencies and the community. Developing a CWPP helps clarify priorities to protect life, property, infrastructure, and valued resources. Protecting communities and resources from wildfire is a team effort that cannot be accomplished by any one person or entity.

The CWPP complements local emergency operations plans. It addresses wildfire concerns including risk assessment, critical infrastructure, and preparedness. It recommends an action plan to increase the overall safety and effectiveness of wildfire protection planning within your communities. Local officials collaborate with planners to guide the process.

Some background
After the large wildfires in 2012, the state legislature passed the Wildfire Control Act of 2013, which provided funding for single-engine air tanker bases, cost share for hazardous fuels reduction, and expansion of programs to provide volunteer fire districts with more fire suppression equipment. As these programs were implemented, Nebraska Forest Service staff realized there were very few Community
Wildfire Protection Plans in place across the state. CWPPs are needed for an area to qualify for many wildfire-related grants and cost-share programs.

The South Central East CWPP is one of 14 plans that the NFS is preparing in Nebraska to create a statewide CWPP network. NFS is also updating the five CWPPs that were completed in 2014 and 2015 and are now due for their periodic review.

Why should we have a CWPP?
• Past wildfires throughout Nebraska have presented many challenges and issues
• A CWPP is a mitigation and preparedness plan to reduce wildfire risk
• It establishes a collaborative relationship among entities BEFORE a fire occurs
• It develops a pre-attack plan to maximize firefighter readiness and safety
• It increases grant application success by documenting wildfire planning and projects
• Fuels reduction grant funds are only available for areas that have a CWPP

Community benefits
• Define planning boundaries that address local concerns
• Identify and prioritize areas for hazardous fuel reduction treatments
• Recommend treatment methods
• Strengthen local efforts to reduce structural ignitability
• Enhance emergency management and communication
• Foster public education/action to reduce wildfire risk

How much does it cost?
The Nebraska Forest Service is covering the costs associated with the CWPP. Counties and fire departments will not be asked for monetary contributions.

How does it work?
The first step is to put together a steering committee to guide the process and ensure that local issues are front and center in developing the plan. Steering committees may include county board representatives, emergency managers, fire department personnel, natural resources professionals, and other interested individuals. The committee defines priority areas, identifies topics and issues important to local emergency responders, and provides general guidance as the plan is prepared.

Once we have gathered the information, we will prepare a draft plan for review, incorporate edits and changes, then finalize the plan and make it available to all. This process usually takes less than a year. Counties are invited to sign the finalized plans.

Further information is available by emailing sbenson4@unl.edu or call Sandy Benson at 402-684-2290.

Fire Departments
(This was sent via e-mail 8/18/2021 along with the survey in Appendix H)
To: Fire Departments
cc: Emergency Managers
From: Sandy Benson, Nebraska Forest Service
Subject line: Fire Dept. Info - Community Wildfire Protection Plan - Please respond!
Attachments: VFD Survey, Background Info for VFDs, Map of NFS CWPP areas

Fire Departments: Please use the attached form to update your fire department info as we prepare the regional Community Wildfire Protection Plan for your area. Please return as soon as possible via scan/email reply to this message (preferred) or snail mail to the address on the last page of the form. Thank you!

The background info shown above was attached to the VFD outreach email, with the following paragraph added:
Including up-to-date information from local fire departments is important. Please complete and return the attached questionnaire. It helps identify your department’s needs and concerns and provides a current listing of your capacity.

Cities and Villages
Villages and cities were emailed outreach flyers on 8/19/2021.

Other Stakeholders
Outreach flyers were emailed to NRDs, state and federal natural resources agencies, Non-government organizations (NGOs), and state and federal legislators in July and August 2021 during the steering committee outreach process. In addition, general news releases provided public input outreach and notification of the draft public review and comment period.
Media Releases

Print Media and Radio

An invitation to participate was published in local newspapers and sent to local radio stations on August 19, 2021:

Local input needed for community wildfire protection plan

Local counties are working with the Nebraska Forest Service to create a Community Wildfire Protection Plan (CWPP) to enhance collaboration and communication among the various agencies and organizations that manage fire in the south central east part of Nebraska, and to help them effectively prepare for and respond to wildfire. People who work with land management, fire, or community preparedness, and other interested individuals are invited to provide input.

The CWPP area includes Adams, Clay, Fillmore, Jefferson, Nuckolls, Saline, Thayer, and Webster Counties. Landowners in counties that adopt the plan will be eligible to apply for federal and state cost-share funds for vegetative fuels reduction and other hazard mitigation efforts in at-risk areas within the CWPP boundary. The plan may also provide increased opportunities for counties, municipalities, and rural fire districts to seek grant funding for other activities related to fire protection.

The plan, part of a statewide network of Community Wildfire Protection Plans, provides information useful to local emergency responders and those from outside the area who provide mutual aid. The CWPP consolidates and relays critical information needed for responders in unfamiliar terrain. Each county can include details vital to protecting its first responders, residents, and property.

A CWPP is a tool for fire departments, agencies, emergency managers, public officials, and land managers to use when addressing wildfire concerns. It contains a fire mitigation plan for each county that includes:

- Community profile (area description, roads, land use, location of at-risk areas)
- Wildfire risk assessment (fire history, fire hazard, protection capabilities, infrastructure)
- Structure analysis (fire risk rating and ignitability)
- Hazardous fuels reduction recommendations
- Emergency operations (responsibilities, capabilities, partners, mutual aid agreements)
- Recommendations for improving community preparedness
- Contact information and equipment lists for rural fire departments

Feedback from local residents may include topics such as identification of ingress/egress routes and safe zones for citizens, structures and critical infrastructure (highways, cell towers, bridges, schools, etc.), areas with homes or developments in high-risk areas, and high-risk ignition sources.

People may have additional concerns or suggestions. All ideas are welcome. For further information or to provide comments, call 402-684-2290 or email sbenson4@unl.edu

Follow-up News Releases

Media releases for draft review and publication of final plan were distributed in 2022.

Online Outreach

On August 10, 2021, NFS staff added information about the South Central East CWPP to the Nebraska Forest Service website: https://nfs.unl.edu/community-wildfire-protection-plan. During the planning process, staff posted periodic updates on the page, including links to the draft and final documents.

On August 18, 2021, NFS staff posted the public outreach news release for the South Central East CWPP on the Nebraska CWPP Facebook page: https://www.facebook.com/groups/4511345652933952/. During the planning process, staff posted periodic updates to this page, including milestones reached and links to the draft and final documents.

Stakeholders List

County Boards and Emergency Management
Adams, Clay, Fillmore, Jefferson, Nuckolls, Saline, Thayer, and Webster

- Wildland Urban Interface Mitigation Strategies
- Structural Ignitability Reduction Practices
- Firewise® Landscaping
- Nebraska Fire-Resistant Plant List
Wildland Urban Interface Mitigation Strategies and Structural Ignitability Reduction Practices

1) Develop a program to increase awareness of Firewise® standards for community defensibility and designate, for firefighter safety, which homes and/or parts of communities are not defensible
2) Introduce and expand the understanding of the “Home Ignition Zone” and emphasize how survivability depends on maintenance necessary to reduce and manage home ignition potential
3) Create guidelines for developers and property owners who intend to construct roads, driveways, and dwellings to provide the following:
   a. Name, address, and GPS location for each road, driveway, and building site
   b. Fuel treatment standards for the areas between building sites
   c. Evidence that Firewise® building standards and defensible space information has been provided to every lot and homebuyer or develop Firewise® based requirements for new building construction standards
   d. Road construction and maintenance standards that accommodate emergency equipment
   e. Require at least two access routes for developed areas and subdivisions
   f. Designate locations for maintained safety zones and water facilities
4) Subdivision residents can work together to improve defensibility of their whole subdivision; this could include connecting home site defensible space areas and/or fuel hazard reduction and thinning 150 to 200 feet from buildings
5) Develop accurate maps for subdivisions and access roads
6) Treat fuels along strategic roads
7) Long driveways in wooded areas should be graveled and provided with terminus turnaround that has at least a 45-foot radius or a pull-in and pull-out facility
8) Mark driveways without turnaround or with steep slopes with a sign indicating limitations
9) Mark safety zones and helispots where fuel continuity is dense, and zones are not obvious
10) Develop and implement a standard for signing roads and addressing and marking homes for more efficient emergency access

Wildfire Risk to Communities interactive website: https://wildfirerisk.org/
Homeowners value landscapes for the natural beauty, privacy, shade and recreation they offer and frequently select properties that include or are near woodlands or other natural areas to visually expand the landscape. One of the risks of properties adjoined to natural areas, however, is that they can be more vulnerable to wildfires.

Creating Defensible Space
In fire-prone areas, property owners can take measures to minimize the risk of wildfire damage by creating a “defensible space” around the home or other buildings. Some of the ways to create more Firewise® landscapes include:

- Planting lower-growing plants or groundcovers near the home to form low, dense mats with strong root systems
- Avoiding the use of tall grasses close to buildings since they can ignite easily and burn rapidly
- Mulching with rocks, gravel or other hardscaping around the foundation instead of bark, pine needles or other flammable mulches
- Paving patio areas and creating raised beds to create firebreaks
- Planting low-growing succulent shrubs rather than taller, resinous evergreen shrubs
- Spacing trees so that tree crowns are 10 feet from each other
- Pruning dead limbs
- Removing dried annuals or perennials
- Raking leaves and litter as they build up
- Placing screens beneath decks to keep leaves or woody debris from collecting underneath
- Keeping wood piles at least 30 feet away from the house
- Providing open access for firefighting equipment that is not limited by fences, trees, or other obstructions
- Keeping propane tanks a good distance from buildings, and taking care when refueling garden equipment
- Using non-flammable outdoor furniture

Selecting Firewise Plant Materials
No plant species is entirely fireproof. Virtually any vegetation can fuel a fire, but some species are more resistant than others. The following information can help property owners select more fire-resistant plant materials, but where they are planted and how they are cared for can be just as important as the plants themselves.

- Planting a variety of sizes and species of plants in small, irregular clusters creates a better barrier than large masses of a single species
- Groundcovers or other plants that grow close to the ground offer less fuel
- Conifers or other plants are high in very flammable resin, so it’s best to keep them thinned and pruned—especially close to the ground
- Conifers with thick bark and long needles are more able to withstand fire
- Deciduous plants tend to be somewhat more fire-resistant
- Deciduous plants have higher moisture content, are less flammable and, when dormant, offer less fuel
- Drought-tolerant plants tend to be more fire-resistant as they are likely to contain lots of moisture (succulents) or to shed leaves or needles during extreme drought
- Plants with open, loose branches and minimal vegetation (such as currant and mountain mahogany) are less of a hazard, as are plants that grow slowly and need little pruning
- Plants, like aspen, that can resprout following a fire will more quickly rejuvenate a landscape

Using Native Prairie Plants
In Nebraska it is often the case that a “Firewise” landscape should also be a “waterwise” landscape where drought-tolerant plants are an important part of the mix. Obviously, our native plants have evolved to grow under natural moisture conditions and many of them are suitable for both a ‘waterwise’ and a ‘Firewise’ landscape. Just a little water here and there can go a long way to keeping such plants green and viable. Another important aspect of using native plants is that they play a vitally important role in supporting biodiversity and all the benefits derived from it. We strongly recommend that native plants be utilized within any landscape, including the Firewise landscape. The trick is to use them appropriately, especially near the home.
Although native prairie grasses and forbs make a lot of sense in a “water-wise” landscape, they can also be highly combustible when they are brown and dry. For a Firewise landscape, prairie plants, especially taller grasses, should be used sparingly and judiciously within the 30 foot “Lean, Clean and Green Zone” nearest the home. A few scattered here and there for ornamental affect are fine, but they should not be massed tightly close to the home. A prairie meadow or thick border planting should be reserved for those areas farther away from important structures.

**Lawn and Groundcover**

One of the best ways to defend a structure against wildfire is to maintain a closely cropped green zone near the home. This typically means the maintenance of a green lawn, but turf grass is not the only choice. Cool-season lawn grasses such as Kentucky bluegrass and tall fescue are good choices, although they can require significant amounts of supplemental irrigation to keep green in dry weather. For sunny areas, a good alternative is buffalo grass, which requires much less moisture than other lawn grasses. Our native blue grama can also be used as a turf alternative, however it will need to be mowed higher – at 8-10” while green and then mowed short when dormant. Recent years has brought the advent of many sedge species as lawn alternatives especially for more shady zones.

Groundcovers don’t need to be grasses or grass-like plants requiring mowing. There are several species of “Firewise” groundcover perennials that make sense including such things as vinca, bergenbia, hosta, bugleweed, geranium, sedum, primrose, pussytoes, snow in summer, Virginia creeper, wild strawberry, and yarrow.

**Introduced Perennials and Ornamental Grasses**

As with native plants, there are many great non-native species that can be used in a “Firewise” landscape that is also “waterwise.” The trick is to place them appropriately and cut them back (clean them up) when they die back late in the season. Some of our favorites include sedum, geranium, coral bells, daylily, lambs ear, feather reed grass, Korean reed grass, and fountain grass.

**Trees and Shrubs**

Although nearly any tree or shrub could burn in a severe fire, it is the highly volatile evergreen species including pine, spruce, fir, juniper, and cedar that pose the most risk when growing near homes or other structures. Within the area nearest the home (30-foot interior zone) it is advisable to exclude volatile evergreens entirely. However, because deciduous trees are so important at casting shade and cooling the home and its surroundings, and because they are not nearly as prone to burning, they can be utilized relatively close to the home. Keep in mind that any branches directly overhanging the roof should be removed. Some of the best deciduous trees for planting near homes include our tough native species including hackberry, bur oak, coffeetree, and honeylocust.

Most deciduous shrubs are acceptable for use in a Firewise landscape. Nearest the home, the shrubs should be kept lower than 30 inches and they should not be massed in tight groupings. Beyond the 30-foot interior zone, the shrubs can be taller and more tightly spaced, however grouping should still be kept relatively small until at least 50 feet from the home. Native species will do the most for biodiversity. Species to consider include mountain mahogany, rabbit brush, sumac, serviceberry, currant, snowberry, gooseberry, plum, and chokecherry.
### Firewise Plants for Nebraska

#### Perennials & Groundcovers
- Artemisia
- Bergenia
- Blanket flower, Gaillardia
- Bugleweed, Ajuga
- Candytuft, Iberis
- Catmint, Nepeta
- Coneflowers, Rudbeckia
- Columbine, Aquilegia
- Coral bells, Heuchera
- Coreopsis
- Daylily, Hemerocallis
- Flax, Linum
- Geranium
- Hens and chicks, Sempervivum
- Iris
- Lambs ear, Stachys
- Penstemon
- Pinks, Dianthus
- Primrose, Oenothera
- Pussytoes, Antennaria
- Sage, Salvia
- Sedum
- Snow-in-summer, Cerastium
- Violets, Viola
- Virginia creeper, Parthenocissus
- Wild ginger, Asarum
- Wild strawberry, Fragaria
- Yarrow, Achillea

#### Shrubs
- Buffaloberry, Shepherdia
- Cherry and plum, Prunus
- Cinquefoil, Potentilla
- Coralberry, snowberry, Symphoricarpos
- Cotoneaster
- Currant and gooseberry, Ribes
- Dogwood, Cornus
- Lilac, Syringa
- Mahonia
- Mock orange, Philadelphus
- Mountain mahogany, Cercocarpus
- Ninebark, Physocarpus
- Rose, Rosa
- Sumac, Rhus

#### Trees
- Aspen, cottonwood and poplar, Populus
- Birch, Betula
- Black cherry, Prunus
- Boxelder, Acer
- Bur, Gambel, Chinkapin oak, Quercus
- Hackberry, Celtis
- Maple and boxelder, Acer
- Ohio buckeye, Aesculus
- Willow, Salix
